The lwarp package

LaTeX to HTML

Abstract

The lwarp package converts LaTeX to HTML by using LaTeX to process the user's document and directly generate HTML tags. External utility programs are only used for the final conversion of text and images. Math may be represented by SVG images or MathJax. More than 500 LaTeX packages and classes are supported, of which more than 90 also support MathJax.

Documents may be produced by DVI or PDF LaTeX, LuaLaTeX, XeLaTeX; by several CJK engines, classes, and packages; or by customized systems such as perltex and pythontex. A *texlua* script automates compilation, index, glossary, and batch image processing, and also supports *latexmk*. Configuration is semi-automatic at the first manual compile. Support files are self-generated. Print and HTML versions of each document may coexist.

Assistance is provided for HTML import into EPUB conversion software and word processors.

Requirements include the commonly-available Poppler utilities (included with MiKTeX) and Perl. Detailed installation instructions are included for each of the major operating systems and TeX distributions.

A quick-start tutorial is provided, as well as extensive documentation for special cases, a general index, and a troubleshooting index. Automatic error testing is provided for configuration files, package load order, and image generation.

SVG math and many other generated images include LaTeX expressions in the `alt` tags. MathJax may be used with advanced equation numbering under the direct control of lwarp.

Complicated tables are supported, which copy/paste well into LibreOffice Writer.

Supported classes and packages include memoir and koma-script, cleveref, caption, mdframed, siunitx, and many popular packages for tabulars, floats, graphics, theorems, the title page, bibliography, indexing, footnotes, and editorial work, as well as a number of CJK-related classes and packages.

TeX is a self-modifying tokenized macro-expansion language. Since lwarp is written directly in LaTeX, it is able to interpret the document's meaning at a deeper level than external conversions which merely approximate TeX. HTML5 and CSS3 are leveraged to provide advanced features such as booktabs trim, multicolumns, side-by-side minipages, and JavaScript-free navigation.

For a quick-start tutorial, see section 5, Tutorial.

For a list of supported features, see table 2: Supported packages and features.

To update existing projects, see section 1: Updates.

Lwarp is still in development. Changes are likely.

Support TEX development

TEX and related projects:

- are mostly open-sourced and a volunteer effort;
- benefit students, academics, scientists, engineers, and businesses;
- help drive education, public and private research, and commercial activity;
- are used in the fields of mathematics, science, engineering, and humanities;
- are international in reach;
- span decades of development;
- are enduring — many older packages are still actively used and maintained;
- are largely backwards compatible;
- are portable across all the major computing platforms;
- are usable even on older computers and away from internet access;
- are continuing to maintain relevance with modern improvements;
- require no yearly subscription fees;
- and are supported by an active community of knowledgeable volunteers.

Please consider helping by joining and/or contributing to the TEX Users Group, a United States 501(c)(3) tax-exempt charitable organization. Contributions are accepted by credit card, check, or Pay Pal, via the United Way, or by USA or European bank transfer. Membership in TUG supports the development of TEXLive, the major TEX distribution.

Donations may be directed towards individual projects:

TUG Bursary Fund: Assistance for attending annual TUG meetings.
CTAN: The Comprehensive TEX Archive Network — Central storage for TEX.
TeX Development Fund: Support for specific projects.
EduTeX: Teaching and using TEX in schools and universities.
GUST e-foundry fonts: Enhanced for math and additional language groups.
LaTeX Project: Modernizing the LATEX core.
Libre Font Fund: Fonts, tools (FontForge), and distribution (the Open Font Library).
LuaTeX: Combining the PDF TEX engine and the Lua language.
MetaPost: Postscript graphics.
MacTeX: TEX for Mac.
PDF Accessibility: Modern PDF standards.
Other: Additional projects may be specified.

1 Updates

The following is a summary of updates to lwarp, highlighting new features and any special changes which must be made due to improvements or modifications in lwarp itself.

For a detailed list of the most recent changes, see the end of the Change History on page 1330.

v0.905: Bug fixes, internal improvements.

- Fixed conflict between cleveref and splitidx.
- Improved coexistence with `\AtEndDocument`.
- acronym: Updated to v1.47, added hyper links.

v0.904a: Fixed missing lwarp-common-mathjax-siunitx package.

v0.904: Added siunitx v3.

- Fixed HTML tags inside non-Latin text.
- MathJax now defaults to SVG rendering.
- Added siunitx v3. Updated siunitx-v2. See section 8.7.14 for limitations.
- Updated caption, chemmacros, fbox, hyperref, multicol, wrapfig2.

v0.903: Various updates and improvements.

lwarpmk
- Error if *pdftotext* not available. Ensures that POPPLER programs are installed.

core
- *ps2pdf*: Allow transparency due to recent changes in *ps2pdf*.

⚠ New images
- Due to changes in how automatically-generated SVG image file names are computed, after **`lwarpmk html`** use **`lwarpmk cleanlimages`** a single time, and then **`lwarpmk limages`** to generate the new images.
- Improved back refs.
- Fixed `verbatim*`.
- Various internal updates for recent LaTeX release.

packages
- cuted: Updated to v2.0.
- flushend: Updated to v4.0.
- mathalpha: Updated for v1.14+.
- minted: Updated to v2.6.
- cases: Updated to v3.2.
- siunitx with MathJax: Improved `\per`, `\numlist`, `\SIlist`, comma decimal points.
- Added showlabels, wrapfig2.

v0.902: beamerarticle, footnotes, paragraph tags.

core
- Fixed footnotes inside descriptions, minipages, amsthm, `\nameref`.
- Improved various paragraph tags.

packages
- Improved parnotes, sympytex.
- Added beamerarticle.
- Updated luatexko, xetexko, tagpdf.

MathJax
- Added missing standard international text symbols for MathJax.

v0.901: Tabular columns, float caption CSS, MathJax packages.

core
- Added `warpsvg` to isolate SVG math, as opposed to `warpMathJax`.
- Improved float caption CSS for newer browsers.
- Improved emulation of `\newcolumntype`.
- Added `\HTMLnewcolumntype`. See section 7.6,
- `>{\centering\arraybackslash}`, etc. now sets HTML CSS `text-align`. Also detects `\itshape`, `\bfseries`, and `\bfseries\itshape`. See section 8.10.1.

MathJax
- Now uses MathJax 3.2 packages for centernot, colortbl, gensymb, mathtools, textcomp, upgreek.

packages
- dcolumn: Now works inside a `lateximage`.
- Added mwe.
- Added lltjp-tascmac, which fixed ascmac.

v0.900: Package updates.

core
- Fix for detecting `\usepackage{lwarp}`.

packages
- amsmath: Fixed `alignat` with MathJax.
- changes: Updated to v4.2.1.
- froufrou: Updated to v1.4.0.
- lipsum: Updated to v2.3.

v0.899: Minor updates.

core
- *lwarpmk*: Warns if `\usepackage{lwarp}` is not detected.

packages
- graphics: Added support for `keepaspectratio`.
- keyfloat: Fix: `lw` with `h`.
- multicol: Improved CSS.

v0.898: Minor updates.

- Fewer underfull `\hbox` warnings.
- wrapfig: Improved integration with keyfloat.

v0.897: siunitx rollback.

docs
- Added a table of file extensions to use with `\includegraphics`. See table 9.

core
- Added tests for additional incompatible packages.

packages
- siunitx: Supports rollback to v2. Does not yet support v3.
- fixme: Improved to work if the user modifies layouts.
- float: Improved integration with newfloat, keyfloat.
- Added centerlastline, decorule, fancypar, froufrou, pbalance.
- Verified works as-is with fnpct.

v0.896: Back references, accessibility.

⚠ • Due to changes in cross referencing, execute **`lwarpmk clean`** before recompiling.

- Increased sectioning nesting stack depth. Error if overflow stack.
- Fixed footnotes at the end of the document, or inside a `description` label.
- Added an error if using braces inside `\usepackage` options.

MathJax
- Fixed footnotes in bracket display math with MathJax.

theorems
- LaTeX theorems, amsthm, ntheorem, theorem: Print theorem footnotes following theorems.

accessibility
- Added HTML `<main>` element to each page.
- Added ARIA `math` role to SVG math images, and `note` role to margin notes, footnotes, etc.

packages
- Improved citation backreferences for various packages.
- chemfig: Updated to v1.6a.
- bigdelim: Updated to v2.8.
- xetexko: Updated to v3.1.
- hyperxmp: Fix: Accept and discard additional keys.
- hyperef: Fix: Added `\*autorefname` macros.
- biblatex: Fix: Back references.
- tocloft: Fix: `\cftpagenumbersoff`, `\cftpagenumberson`.
- threeparttablex: Fix: `\TPTL@tnotex`.
- amsthm: Fix: Footnotes inside environment optional argument.
- listings: Fixed labels. Accepts but ignores escapes w/o error.
- pdflscape: Fix: Added `landscape` environment.
- Added ccicons, classicthesis, orcidlink.
- Added enotez.
- Verified support for doi, doipubmed.

v0.895: Vector packages, greatly improved MathJax for siunitx.

core
- Fixed quotes in HTML tags while using old font packages with XeLaTeX and LuaLaTeX.

MathJax
- Added `\ifblank` and `\ifstrequal` to MathJax emulation.

packages
- multirow: Allow `\par` per v2.7.
- acro: Updated to v3.5.
- fancyhdr: Updated to v4.0.
- changes: Updated to v4.0.1.
- epsfig, rotating: Now work inside `lateximage`.
- amscdx: Verified to work with SVG math. Warning added about use with MathJax.
- Added MathJax emulation for isomath, mattens, maybemath, skmath, tensor.
- Improved MathJax emulation for siunitx `\ang`, `\num`, `\SI`.
- Added epsf, impnattypo, isotope, lpic, luavlna, mdwmath, pinlabel, rlepsf, tikz-imagelabels, xevlna.
- Verified to work as-is: tensind.

v0.894: MathJax additions and improvements.

MathJax
- Improved warning message for enabling svg graphics for select math expressions while using MathJax.
- Accept and ignore a star for `\hspace`.
- Ignores `\arabic`, `\number`, `\noalign`.

packages
- Added MathJax emulation for backnaur, colortbl, nicematrix.
- booktabs: MathJax emulation now absorbs and discards trim.
- menukeys: Updated to v1.6.1.

v0.893: Minor fixes, more packages.

MathJax
- Added MathJax emulation for `\mathnormal`.

packages
- Fixed pstricks `pspicture*`.
- Fixed tikz font macros.
- braket: Now uses the MathJax extension.
- Added esvect, fixmath, keystroke, mathastext, menukeys, picinpar, plimsoll, repltext, selectp, seqsplit, simplebnf, statistics, swfigure.
- Added MathJax emulation for mathspec.
- Verified to work as-is for apxproof, syntaxdi, venndiagram.

v0.892: minted, fvextra, MathJax `\left`/`\right`.

MathJax
- fourier, libertinust1math, newpxmath, newtxmath, newtxsf, unicode-math: Added MathJax`\left`/`\right` support for additional delimiters.

packages
- textpos: Updated to v1.10.
- xcolor: Fixed optional args for `\fcolorbox` and related.
- Added fvextra, minted.

v0.891: MathJax additions and improvements.

core
- Now displays inline `\verb` text as `\texttt`.
- Fixed alltt and verbatims with LaTeX lists.
- Now generates an error if nested each of `warpHTML`, `warpprint`, `warpMathJax` inside itself.

MathJax
- Added MathJax *textmacros* extension, allowing formatting inside `\text`.

packages
- biblatex, hyperref: Added back page references.
- fancyvrb: Fixed `BVerbatim` with a label.
- listings: Fixed MathJax with captions, improved HTML sanitation.
- babel-french: Fixed `\texorpdfstring` conflict.
- Now honors Greek package options for mathdesign, mathpazo, mathptmx, newpxmath, newtxmath.
- Improved MathJax for colonequals, mathdesign, mathdots, mathfixs, mathtools, multiobjective, nicefrac, shuffle, units.
- unicode-math: Added Greek macros, as well as macros for the first several categories listed in **`texdoc unimath-symbols`**. Improved symbol shape macros with Greek. Improved documentation.
- Added bussproofs, cmbright, fourier, kpfonts, kpfonts-otf, libertinust1math, scalerel, txgreeks.

v0.89: Additional MathJax support.

core
- Adapted to upcoming LaTeX kernel changes.
- Allows load of amsmath before lwarp.

lwarpmk
- Also removes `*.bbl` when cleaning aux files.

MathJax
- MathJax: Neutralized `\protect`, `\mathcode` and related, ligatures. Fixed nested environments.

packages
- caption: Updated for v3.5, fix for label sep.
- thmtools: Updated for v0.72. Fixed `swapnumber`, `margin`.
- Improved MathJax for centernot, mathtools, mismath, SIunits, siunitx, statmath.
- Added MathJax emulation for accents, hepunits, hhtensor, mathalpha, mathdesign, mathpazo, mathptmx, mleftright, newpxmath, newtxmath, newtxsf, pxfonts, shuffle, txfonts, upgreek, ushort.
- Verified to work as-is: authoraftertitle.

v0.88: Indexing, boxing, theorems.

- Now has programmed support for more than 500 packages and classes, of which more than 60 also support MathJax.

core
- Fixed: `\ref*`, and also added MathJax emulation.
- If starting a new paragraph, `\hrulefill` creates a `<div>` with a thin horizontal line across the page. Use instead of `\hrule`.
- Fixed: Use `\chaptername` where appropriate.
- Fixed: Inline links causing extraneous paragraphs.

lwarpmk
- Added **`lwarpmk -v`** to print the version number.

indexing
- Added the `IndexRef` option to control the display of index entries. See section 7.5.
- Added `\IndexPageSeparator` and `\IndexRangeSeparator` for custom index styles.
- Added support for gindex, *xindex*.
- Verified to work as-is with varindex.

packages
- cleveref, varioref: Fix for starred macros.
- varioref: Removed page-related text from HTML output.
- xfakebold: Updated to v0.08, using pdfrender.
- caption, scrextend: Fixed `\caption*`.
- Added fbox, shadethm, tcolorbox, termcal, thmbox, thmtools.

v0.87: MathJax, bibliography packages.

core
- Added boolean `FixSmallCaps` for fonts which render small caps as all caps.
- Fixed `\bibliography` to use the HTML version's `.bbl` file. Previously the HTML bibliography relied on the print version's `.bbl`, thus would fail if the print document had not yet been created.

MathJax
- Added `\ifstar` and `\ifnextchar` to MathJax, and removed `\DeclareIfstar`. See section 8.7.6.

⚠ Removed `\DeclareIfstar`

packages
- physics: Now supports the MathJax v3 extension.

- mathtools: Improved `\underbrakcet`, `\overbracket` for MathJax.
- nccmath: Improved `\underrel` for MathJax.
- mhchem: Now supports the MathJax v3 extension for `\ce` inside math.
- cancel: Now supports the MathJax v3 extension.
- embrac: Neutralized kerning for improved HTML conversion.
- Added citeref, drftcite, jurabib, multibib, splitbib.
- Verified to work as-is with bibtopic, collref, mciteplus.

v0.86: MathJax major updates.

core
- Fixed: Filename if named files with `*`, parens, period in section name.
- Fixed: Labels in `eqnarray`, `lateximage`.

MathJax
- Updated to MathJax v3. New repository.
- Fixed forward references for MathJax.
- Improved MathJax equation number formatting, now compatible with amsmath `\numberwithin` for chapters, sections, subsections, as well as amsmath `subequations`. See section 8.7.6.
- Added `\DeclareIfstar` to define starred TEX macros in MathJax. See section 8.7.6.
- Generates an error if `\MathJaxFilename` file does not exist.

packages
- mathtools, nccmath, physics: Added starred macros for MathJax.
- nccmath: Fixed `\nr`, `\displaybreak` for MathJax.
- xcolor: Fixed `\textcolor` with babel-french.

v0.85: fontspec

packages
- fontspec: Fixed core font change macros for world languages.

⚠ acro formats
- acro: Due to v3 changes, when defining acronym formats, use `\textbf` instead of `\bfseries`, etc.
- Fixed idxlayout, mathtools, titlesec, url.

v0.84: Previous/next page links, numerous fixes.

docs
- Added documentation of `BlockClass` and `\InlineClass` for css `<div>`s and `<span>`s. See section 7.8.
- Added `\LinkPrevious`, `\LinkNext` page links. See section 7.6.

⚠ home page footer changed
- Added `\FirstPageBottom`. Home page no longer shares `\PageBottom`. See section 7.6.

core
- Improved coexistence with comment, support for nested environments.
- No longer requires but still supports the caption package.
- Improved filenames and HTML titles when using special characters.

⚠
- Change: Append `-0` to section named Index previously _index to distinguish from `index.html`
- Fixed style tags for `\multicolumn`, `\multirow`.
- Fixed spacing in `tabbing`.
- Fixed `lateximage` for: `quote`, `quotation`, `verse`, `center`, `flushleft`, `flushright`, `<par>` tags, packages verbatim, alltt, epigraph.

- Fixed textcomp due to integration into LaTeX kernel.
- Fixed `\itshape`, etc. Adapted to LaTeX fontaxes integration.
- Fixed `\@fnsymbol`.
- Warns about section names with dollar-delimited math.
- Warns about a `<span>` containing a float, caption, section, mdframed, or other `<div>` object.
- Only warn about XeTeX logo and graphics if actually used `\Xe`.

lwarpmk
- **`lwarpmk clean`** also removes `comment_*.cut`.

packages
- scrextend, scrartcl, scrbook: Added `\titlehead`, `\subject`, `\subtitle`, `\publishers`.
- titling: Fixed `\printthanks`.
- memoir, abstract: Fixed for updated memoir.
- memoir: Fixed `\newcomment`, pagenotes, crossreferences. Fixed setting a recursive name.
- Fixed or improved: amsthm, backref, biblatex, fixme, nfssext-cfr, ntheorem, parcolumns, realscripts, rotfloat, titling.
- Added boxedminipage, renamed from boxedminipage2e per author.
- Verified to work as-is with mcite.

v0.83: memoir fixes.

packages
- memoir: Various fixes and updates.
- physunits: Updated to v1.0.4.

v0.82: MathJax notes, xpinyin improvements, various updates.

MathJax
- Improved footnotes with MathJax.
- Added MathJax emulation for endnotes, marginnote, nccfoots, pagenote, parnotes, sidenotes.

packages
- xpinyin: Added pinyin with modern HTML.
- luatexko: Added `\dotemph`, `\ruby`, `\uline`, etc.
- soul: Fixed `\<`.
- chemfig: Updated to v1.5.
- draftwatermark: Updated to v2.0.
- ulem: Fixed: `\dashuline`.
- amsmath: Fixed: `\intertext` with MathJax.
- endnotes: Fixed: Marks in print mode.
- tocvsec2, tableof: Verified to work as-is.
- Added etoc (nullified).

v0.81: MathJax speedup and additional emulations.

core
- Improved warning regarding SVG math sizing / baselines and graphics / graphicx. See section 8.7.

MathJax
- Improved MathJax emulation processing speed.
- Added MathJax emulation for accsupp, axessibiltiy, colonequals, decimal, dotlessi, econometrics, engtlc, multiobjective, physunits, Slunits, stackrel, statmath.

packages
- axessibility: Updated to 2020/01/08 version.
- gridset: Updated to v0.3.
- SIunits: Fixed for math mode.
- Added DotArrow, nolbreaks, luamplib, returntogrid, statex2, tagpdf.
- Verified to work as-is with icomma, mathpunctspace, textualicomma.

v0.80: MathJax, biblatex.

MathJax
- Added docs and warning/info messages re: avoiding slow MathJax compilation. See section 8.7.6, Customizing MathJax.
- Added MathJax emulation for accessibility, autobreak, centernot, extarrows, fouridx, gensymb, leftidx, mathcomp, mathdots, mathfixs, mismath, nccmath, noitcrul, pdfcomment, relsize, rmathbr, subsupscripts, xfrac.
- Improved MathJax emulation for unicode-math.

packages
- biblatex, url: Now create hyperlinks.
- amsmath: Fix to center starred environments.
- xcolor, graphics: Made more macros robust.
- colortbl: Fix: Rule color in a `lateximage`.
- chemmacros: Updated to v5.10.
- Added fewerfloatpages, ghsystem, hhline, mismath, nccmath.

v0.79: MathJax, nested `tabular`.

MathJax
- Added or improved MathJax emulation for amsmath, ar, arydshln, bm, bigdelim, bigstrut, booktabs, braket, mathtools, multirow, physics, siunitx, slashed, unicode-math, xfakebold.
- Warn if using certain packages not supported by MathJax.

core
- `tabular`: Now may be nested.
- `minipage`, `\parbox`, `fminipage`, `\makebox`, `\framebox`: Fix: Adjust for virtual page size.
- Uses new iftex.

packages
- graphicx: Fix: Negative angles.
- caption: Fix: `\captionlistentry` with longtable.
- multirow: Fix: Centered vertical alignment.
- siunitx: Fix: `\square`, `\cubed`.
- booktabs: Fix: memoir with `lateximage`.
- babel and polyglossia: Added troubleshooting warnings.
- fontawesome, fontawesome5: Supports text color and size.
- transparent: Fix: `lateximages`.
- epigraph: Updated to v1.5e.
- xurl: Updated to v0.08.
- subcaption: Fixed with memoir.
- floatrow: Fix: `\linewidth`. No longer require float, graphics.
- floatflt, wrapfig, niceframe: Fix: Adjust for virtual page size.
- Added widetable, witharrows, steinmetz.
- Added awesomebox, catoptions.

- Added svg, supports svg-extract.
- Added parcolumns, pdfcolparcolumns,
- Added parallel, pdfcolparallel.
- Added pdfcol, pdfcolfoot, pdfcolmk.

v0.78: Fixes for support files, `alt` tags, hyperlinks, and the 2019/10 LaTeX release.

docs
- Docs: Improved documentation regarding package options. See section 8.1.

- Fix to overwrite existing support files using new `filecontents` environment.

packages
- breqn: Previously broken by the 2019/10 LaTeX update, but now working again.
- graphics: Fix for `\includegraphics` `alt` tags.
- babel-french: Fix for hyperlinks.
- media9, movie15, multimedia: Fix for the 2019/10 LaTeX update.
- accessibility: Added.

v0.77: Updates to fix recently-broken packages.

- booktabs: Updated to v1.6180339.
- chemformula: Updated to v4.15.

v0.76: MathJax, updates for LaTeX 2019/10 release.

docs
- Docs: Expanded documentation regarding the use of multiple projects in the same directory. See section 5.17.

MathJax
- MathJax: Updated to v2.7.6.

packages
- xr: Updated to v5.05.
- xr-hyper: Updated to v6.1.
- Verified works as-is with xcite.
- acro: Updated to v2.10.

⚠ broken
- Currently broken in print mode by the 2019/10 LaTeX update, and waiting for fixes: breqn, grffile, multimedia, movie15.

v0.75: keyfloat, wrapfig

- `\minipage`: Fix for `\linewidth`.

packages
- keyfloat: Improved color control.
- wrapfig: Fix for `\linewidth`.

v0.74: Docs, SVG math, *lwarpmk*, HTML `alt` and `title` text, lyluatex

docs
- Added to the tutorial the section What next?. See section 5.19.
- Added documentation about localization options. See section 7.1.
- Added documentation about accessibility options. See section 7.2.

HTML `alt` text
- Renamed and updated HTML `alt` text macros:

⚠ changed names

Old	New
(hard coded as “image”)	`\ImageAltText`
`\mathimagename`	`\MathImageAltText`
`\packagediagramname`	`\PackageDiagramAltText`

- Added `\ImageAltText` for the default HTML `alt` text for an image. See section 7.6.
- Added `\ThisAltText`, which may be used to assign a one-time HTML `alt` tag to the very next image generated by lwarp, such as a `lateximage`, `picture`, `tikzpicture`, an image generated by various chemistry or engineering packages, or an SVG math image. This macro also adds a `title` tag to a reference or hyperlink. See section 7.6.

SVG math
- Adjusted `\LateximageFontScale` default from .75 to 1.
- Fix: Font control for SVG math.

misc
- Fix: Ignores negative `\hspace`.
- Warning if `SideTOCDepth` < `FileDepth`.

lwarpmk
- *lwarpmk*: **`lwarpmk clean`** removes additional files.
- *lwarpmk*: **`lwarpmk epstopdf`** and **`lwarpmk pdftosvg`** now honor directories.

packages
- lyluatex: Split images by `system` or per `fullpage`, improved margins and scaling.
- Tested to work as-is with mathspec, unicode-math.

v0.73: `\include`, memoir, koma-script, caption, xy, datatool, music scores.

- Fix for `\include`.
- Warning for a `tabular` inside a `<span>`.
- `\color`: Added HTML support for rules and frames, but not inline text. Use `\textcolor` if possible.
- Improved many HTML tags, reducing *tidy* warnings. See Change History.

packages
- memoir: Fixes for `\frontmatter*` and `\mainmatter*`. Added `\book`.
- koma-script: Fix for starred captions in the TOC.
- caption: Fix for starred captions.
- datatool: Added pie, bar, and plot charts.
- threeparttable: Added `measuredfigure`.
- intopdf: Updated to v0.2.1.
- tocdata: Updated to v2.03.
- quotchap: Updated to v1.2.
- versonotes: Updated to v0.4.
- backnaur: Now uses SVG images. Updated to v3.1.
- xy: Fix for `\xybox`, improved xy, also now compatible with qcircuit.
- fancyvrb: Fix for label HTML tags.
- Added stackengine.

music
- Added lyluatex. (Music scores.)
- musicography: Updated to 2019/05/28. Added support for `lateximages`.

v0.72: Font control, `\multicolumn`, xr and xr-hyper.

⚠ images
- Due to internal changes, images for inline SVG math and `lateximages` will have new hash values, and will have to be regenerated using

  Enter ⇒ **`lwarpmk cleanlimages`**

  and

  Enter ⇒ **`lwarpmk limages`**

- Docs: Color-codes package names in the table of supported packages and features, table 2, according to each package's level of support by lwarp.
- `\multicolumn`: Fix for paragraph columns.

packages
- xr, xr-hyper: Fixes for references, `\externaldocument`.
- soulutf8: Fix: Loads soul for emulation.
- boxedminipage2e: Added support for `lateximages`.
- zhlineskip: Updated to v1.0e.
- Added fontaxes, slantsc, tabfigures.
- Added nfssext-cfr, thus supporting cfr-lm and several other font packages.
- Added backnaur, hypbmsec, minibox, pdfcrypt, shapepar.

v0.71: Error handling, multimedia, `tabular`.

- `tabular`: Added support for '`*`' columns. Fix for paragraph tags.
- `quotation`: Fix for HTML tag.
- Docs: Added a section about error conditions tested by lwarp. See section 13.1.
- *lwarpmk*: If file `lwarpmk.conf` is an older version, or the incorrect operating system, displays the print command to use to recompile.

packages
- chemfig: Updated for v1.4.
- endfloat: Updated for v2.7.
- textpos: Updated for v1.9.1.

multimedia
- Added media9, movie15, multimedia.

v0.70: Error handling, MathJax, mathtools.

- Error handling for "Label(s) changed." Refuses to **`lwarpmk limages`** until recompile first.
- Fix: If Computer Modern font is used, ensures cm-super or lmodern is used.
- Fixes for `\makebox`.
- Fixes for `\parbox` inside a `<span>`.
- MathJax: Updated to v2.7.5. Loads the `autoload-all.js` extension. Added `\MathJaxFilename` to select custom scripts.

packages
- textcomp, xunicode: Fix for `\textinterrobang`.
- mhchem: Works with MathJax. See section 410.
- changes: Updated to v3.1.2.
- Added autonum, changelayout, inputtrc, mathtools, metalogox.

v0.69: Error handling, many fixes, improved keyfloat / tocdata.

- Fix for HTML corruption of `lateximage` displays.
- `\makebox`, `\framebox`: Fix for (⟨*width,height*⟩) arguments.
- `fminipage`: Honors `\minipagefullwidth`.

packages
- array, longtable: Fix for `\tabularnewline`.
- tabularx, tabulary: Fix to require the array package.

- supertabular, xtab: Fix to clear caption after use.
- graphics: Added a warning if used the `\includegraphics scale` option.
- multirow: Added an error if didn't use `\mrowcell` or `\mcolrowcell` when using `\multirow` or `\multicolumnrow`.
- keyfloat: Updated for v2.00, additional improvements.
- Added ctable, eqlist, eqparbox, ftcap, listliketab, minitoc, tocdata, topcapt.

v0.68: Error handling, tabulars, footnotes.

lwarpmk
- *lwarpmk*: Improved error handling for image generation if compile was incomplete.
- `tabular`: Fix for `\warpprintonly`.

packages
- longtable: Improved flexibility for `\endhead`, etc. Improved error reporting if `\endhead`, etc. incorrect for lwarp.
- threeparttable: Fix for caption type.
- hyperref: Fix for options with braces.
- morefloats: Fix to be loaded early for print output.
- listings: Updated for v1.7.
- Added bigfoot, fnpara, footnotebackref, manyfoot, tablefootnote, threeparttablex.
- Added layouts, niceframe, perpage, showtags.
- Prevented alg, algorithmic, pdfcprot, fncylab.

v0.67: Filename generation, symbol fonts.

docs
- Documentation fix for `<project>-images`, `<project>-images.txt`.
- Added discussion regarding section names. See section 8.4.

filenames
- Added `\FilenameNullify` and `\FilenameSimplify` for filename generation. See section 8.4.
- Core, textcomp, xunicode: Nullified additional symbols during filename generation.

packages
- color: Fix for version number warnings.
- Added academicons, bbding, dingbat, eurosym, fontawesome, fontawesome5, marvosym, pifont, typicons.
- Added changes, easyReview, fitbox, foreign, gloss, karnaugh-map, multicap, nomencl, notes, struktex, umoline, xfakebold.
- Tested to work as-is with askmaps, curves, euro, karnaughmap, tikz-karnaugh.

v0.66: xr, multiple projects, image names/directory, HTML formatting

⚠ Reset the configuration
- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

`lateximage`
- Adds options `ImagesDirectory` and `ImagesName` to assign directory and name prefixes for `lateximage` images. The new defaults include the jobname, allowing the image directories for multiple projects to coexist.

⚠ existing projects
- To reuse existing `lateximage` directories, add lwarp options

```
\usepackage[
  ImagesDirectory={lateximages},
  ImagesName={lateximage-}
]{lwarp}
```

If not reused, the existing `lateximages` directory and `lateximages.txt` file may be removed.

filenames
- Added `\FilenameLimit` to control the maximum length of the filenames generated by lwarp.

⚠ Possible filename changes
- Improved filename generation when special characters or macros are used in section names.

Windows
- Fix for **`lwarpmk cleanlimages`** with Windows.

floats
- Fixes for floats in the home page.

lists, table notes
- Improved css for definition lists, table notes.

`tabular`
- `tabular`: Fixes for `\par` in column specifier, minipage inside `tabular`.

indexing
- Indexing: Fix for a long line of multiple entries.

`minipage`
- `\minipagefullwidth`: Fix for global changes.
- Added `\UseMinipageWidths` and `\IgnoreMinipageWidths`. See section 8.3.3.

colors
- Improved `\fbox`, `\fboxBlock`, `\fminipage` to use current text color.

HTML
- Improved HTML output formatting.

docs
- Added discussion regarding invalid HTML. See section 8.1.1.
- Added discussion regarding math in section names, `\imagegraphics` `scale` option. See section 6.
- Added discussion regarding international languages in section names. See section 8.14.

packages
- caption: Fix for options clash.
- xr, xr-hyper: Now compatible.
- subcaption: Improved horizontal spacing.
- multicol: Fix for minipage inside `multicols`.
- multicolrule: Updated for v1.2.
- tocbasic: Minor update.
- acronym: Fix for acronym in float caption.
- kotexutf: Patch with *pdflatex* and new lwarp labels.
- extramarks, fancyhdr: Updated for v3.10.
- memoir: Added docs regarding version numbers. See section 8.13.
- zref: No longer required.
- Added ar, ed, indentfirst, nameauth, truncate.
- Verified to work as-is with changelog.
- Prevented colortab, epsf, hyper, picinpar, picins, sistyle, ucs.

v0.65: css layout, `alt` tags, Japanese.

page layout
- Moved the sideTOC to the left side, allowing improved css for margin notes.
- Improved page layout css.

image `alt` tags
- graphicx `\includegraphics`: Added the `alt` key to assign an `alt` tag to an image. Default is "`image`", assigned to pass validation.

duplicate HTML files
- Detects and causes an error if duplicate HTML file names are generated, caused by identical or similar sectioning names.

fixes
- Fix for `tabular*`.

- Fix for tabular border colors.
- Fixes `\quad`, `\enskip`, and figure captions to pass validation.

Japanese
- Added ltj* classes, bounddvi, gentombow, lltjext, plarydshln, plext, plextarydshln, plextcolortbl, pxatbegshi, pxeveryshi, pxftnright, pxjahyper, tascmac.
- Verified to work with plarray, plautopatch, plextarray, plextdelarray, pxgentombow, plsiunitx, pxpdfpages, pxpgfrcs, pxpgfmark.

packages
- Added support for fontspec `\textsi` and `\sishape`.
- Added multicol's `\docolaction`.
- Added embrac, footnoterange, multicolrule, versonotes.

v0.64: Koma-Script, Japanese, Chinese.

Japanese
- Added utarticle and related classes.
- Improved ujarticle and related classes.

Chinese
- Fix for biblatex with CTEX and other classes.

Koma-Script
- Fixes for scrlayer, scrlayer-scrpage.

packages
- addlines: Updated to v0.3.
- Added bsheaders, gmeometric, marginal, rmpage, scrpage2.

v0.63: mdframed, Chinese, Japanese, Korean

localization
- Added `\linkhomename`: A user-definable name for the **Home** link.
- Documented `\sidetocname`: A user-definable name for the sideTOC.

fixes
- Fix: `\LinkHome` for print output.

optimizations
- Moved package load checks to the lwarp core to reduce the number of `lwarp-*` files.

packages
- mdframed: Fix with amsthm, improved titles and font control. Improved rule widths.

Chinese
- Fixes for xeCJK.
- Added xpinyin, zhlineskip.
- Verified to work with cjkpunct, upzhkinsoku, zhspacing.

Japanese
- Verified to work with zxjatype, luatexja, luatexja-fontspec.
- Added bxjsarticle and related classes.
- Added ltjsarticle and related classes.
- Added pLATEX, upLATEX, ujarticle and related classes.
- Prevented utarticle and related classes.
- Prevented bxcjkatype.

Korean
- Verified to work with kotex, xetexko, luatexko.

v0.62: MiKTEX docs, HTML title, CTEX, xeCJK, bitpattern.

docs
- Docs: Setting a UTF-8 locale. See section 9.9.

MiKTEX
- MiKTEX: Docs for *MiKTeX Console* and miktex-poppler-bin.

HTML `<title>`
- HTML subpage titles: Added `\HTMLTitleBeforeSection` and `\HTMLTitleAfterSection` to select whether the HTML `<title>` displays the website name before or after the section name. See section 7.6.

fixes
- Fix for package options handling.

- Fixes for horizontal white space between `fminipage`, `fcolorminipage`, `colorboxBlock`, `fcolorboxBlock`.
- Logos: Fix for XeTeX logo, improved css, made robust, improved search-engine optimization.
- `\\[$1]`: Additional HTML <br> if $1 > 0 pt.
- Fixes for `\includgraphics` filename, and with `FormatWP`.
- Fix: css for `\textup`.
- Fix: Added `\slshape`.

Chinese
- Added ctex package and related classes, xeCJK.
- Prevented CJK, CJKutf8 unless xeCJK, ctex are used.

packages
- chemfig: Docs for new macro `\polymerdelim`.
- asymptote: Docs for compilation.
- chngpage: Fix to load lwarp-changepage.
- algorithm2e: Fix with non-book classes.
- register: Updated to v1.8.
- nicefrac: Improved font control and css, honors `nice` and `ugly`.
- units: Improved font control and css, honors `tight` and `loose`.
- xfrac: Improved css.
- textcomp and xunicode: Fix conflicts with `\textcircled`.
- ulem: Improved compatibility with CJKulem, `lateximage`.
- MathJax and siunitx: Removed inoperable extension.
- Added bitpattern, pdfcomment, pdfmarginpar, tram, unitsdef, xechangebar.
- Added musicography, octave, semantic-markup.
- Added 2in1, flippdf, notespages, rviewport, twoup.

v0.61: Custom compilation, EPS-related packages, documentation, indexes.

docs
- Split index into multiple indexes.
- Improved documentation regarding font selection. See section 7.4.
- Added documentation regarding debugging options. See section 35.
- Added documentation regarding HTML entities inside program listings. See section 8.2.1.

custom compiling
- Added options to specify the shell commands to execute for **`lwarpmk print`** and **`lwarpmk html`**, allowing the use of lwarp with perltex, pythontex, etc. If not specified, these are set automatically depending on the LaTeX engine, `--shell-escape`, and lwarp options. See section 9.

⚠ changed names
- Changed macro names to match `\displaymathother`, `\displaymathnormal`:

Old	New
`\StartDynamicMath`	`\inlinemathother`
`\StopDynamicMath`	`\inlinemathnormal`

fixes
- Fix: Paragraph tags in a `tabular`.
- Fix: supertabular and xtab captions.
- Fix: DVI LaTeX `\includegraphics` EPS images.
- Fix: newfloat lists.
- Fix: css footnotes text align, minipage tabular and footnote margins.

packages
- Added epsfig, psfrag, psfragx, pstool.
- Added copyrightbox, pdfprivacy, thinsp, threadcol, uspace.
- Added chkfloat, cmdtrack, dprogress, lua-visual-debug, refcheck, srcltx, srctex, vpe, xbmks.

v0.60: Fixes for longtable, listings.

fixes
- longtable, etc.: Fixes for slowdown and memory management for very long tables.
- listings: Fix for HTML entities, and also when used inside a list.
- diagbox: Fix for incorrect HTML par tags.

packages
- Added 2up, booklet.
- Added bophook, draftfigure, fullminipage, grid-system, layaureo.
- Added leading, widows-and-orphans.
- Added fancytabs, thumb, thumbs.

v0.59: DVI *latex*, MATHJAX, asymptote, pdftricks and pstricks, epstopdf, brqen.

⚠ Reset the configuration
- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

lwarpmk
- Added an error if `lwarpmk.conf`'s format has changed and the document must be recompiled.
- Added a warning if the `lwarpmk.conf` configuration file appears to be for the wrong operating system, in case files are transferred between systems.
- Added
  ```
  lwarpmk epstopdf <list-of-EPS-files>
  ```
  to quickly convert a document's EPS images to PDF or SVG. See section 8.8.

DVI *latex*
- Added support for DVI *latex*. See section 7.5.

latexmk
- Fix for `--shell-escape` with *latexmk*.

math
- Updated MATHJAX script to v2.7.4.
- Fix: MATHJAX chapter number removed from non-numeric tagged equations.
- Added MATHJAX support for nicefrac, units.
- Fix for `\[` and `\]` with `\displaymathnormal`.

images
- Fix for `\includegraphics` filename expansion.
- `\includegraphics` now works with `.pdf` and `.eps` filename extensions.

packages
- Moved amsmath out of the lwarp core.
- Fix for chemformula `\NMR`.
- Added asymptote, pdftricks, pstricks, pst-eps.
- Added breqn, SIunits.
- Added bxpapersize, canoniclayout, draftcopy, fnbreak, nccfancyhdr.
- Added accsupp, axessibility.
- Added xunicode.
- Improved and now supports epstopdf.
- Tested to work as-is: eepic, sepfootnotes.

docs
- Added information about setting up a development version of lwarp.

v0.58: Extensive improvements in indexing, glossaries. Adds PDF-inclusion packages.

⚠ Reset the configuration

- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

lwarpmk

- *lwarpmk*: Added the `-p` option to specify the project name.

glossaries

- *lwarpmk*: Now uses *makeglossaries* for glossary generation, allowing the processing of multiple glossaries at once.
- Added lwarp option `GlossaryCmd` to specify the shell command used by **`lwarpmk printglossary`** and **`lwarpmk htmlglossary`**. Defaults to **`makeglossaries`**.

index and glossary

- Docs: Extra indexing options. See section 8.6.14.
- Added support for *makeindex*. (Previously supported only *xindy*.) Also added indexing packages listed below.
- Added lwarp options `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to specify shell commands used by **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, and *latexmk*. May be preset with the `makeindex` or `xindy` lwarp options. See section 7.5.
- Added lwarp options `makeindex` and `xindy` to set `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to sensible values for a typical single index. See section 7.5.
- Added lwarp option `makeindexStyle` to tell *lwarpmk* to use a custom style instead of `lwarp.ist`. See section 8.6.20.
- Fix for index entries with `\see`, `\seealso`, `\emph`, `\textbf`, etc.

misc. fixes

- Replaced each `\csuse` with `\@nameuse` for improved error detection.
- Additional internal print/HTML macro selection improvements.
- Fix: `\printindex` finishes pending `\index` writes first.

packages

- Fixes for memoir: makeidx, ccaption, multiple indexes, `\specialindex`.
- Fixes for komascript: Indexing improvements.
- Added imakeidx, index, repeatindex, splitidx.
- Added attachfile, attachfile2, intopdf, pdfpages, pdfx.
- Added cases.
- Tested to work as-is: notes2bib, hvindex.

v0.57: algorithm2e, float styles, tabular packages, internal improvements.

MathJax

- Added support for MathJax equations with `\footnote`, `\footnotemark`.

math macros

- Added `\StartDefiningMath` and `\StopDefiningMath` for use when defining macros in the preamble which contain $. See section 8.7.8.

dynamic math

- Added `\inlinemathother` and `\inlinemathnormal` to delimit math expressions which depend on a variable condition such as a counter. Such expressions will not be hashed for reuse, and will be converted to SVG math images even when MathJax is enabled. See section 8.7.9.

⚠ new name

- Renamed `\EndDefiningTabulars` to `\StopDefiningTabulars`.

lateximage alt tags
- Improved localization for lateximage HTML alt tags. For SVG math images, the alt tag under some conditions will be set to \MathImageAltText, which defaults to math image. For packages, the alt tag is set using the package name followed by \PackageDiagramAltText, which defaults to diagram. Ex:
  ```
  (-xy- diagram)
  ```
  See section 7.6.

misc. fixes
- Fix: Improved print/HTML macro selection.
- Fix: \href text catcodes.
- Fix: \subref text.
- Fixes: Colored \rule and \boxframe.

packages
- float, rotfloat: Adds support for float styles ruled and boxed.
- float: Fix: Do not create \l@<type> until \listof is used.
- marginnote: Fix: Long optional argument.
- ellipsis: Adds \midwordellipsis.
- breakurl: Fix for text catcodes.
- Added algorithm2e, register, ltablex, xltabular, xellipsis, trimclip, errata, vowel, xpiano.
- Prevents glossary.
- Tested to work as-is with gauss, phonrule, piano, SIunits, tikzcodeblocks.

v0.56: Shell escape, tabular packages.

lwarpmk
- Added
  ```
  lwarpmk pdftosvg <list-of-PDF-files>
  ```
  to quickly convert a document's PDF images to SVG, for use with HTML. See section 8.8.
- Added support for --shell-escape. See section 7.3.

tabular
- Added support for array w and W columns.
- Fix: \multicolumn parameter handling.
- Added support for double \hlines, \midrules, and vertical rules.
- Added support for arydshln dashed lines with HTML tabular, but reverts to plain rules for lateximage and SVG math array.

misc. fixes
- Fix: \thinspace.
- Fix: paralist compact environments.

packages
- Added parnotes, quoting, lua-check-hyphen, tocenter, underscore.
- Added bibunits.
- Tested to work as-is with babelbib, bodegraph, fast-diagram, nicematrix, structmech.

v0.55: Various fixes.

misc fixes
- Fix: Extraneous space in file links, which also prevented *Calibre* EPUB conversions.
- Fix: Float optional argument regression.
- Fix: \ForceHTMLTOC with \phantomsection.
- Fix: Overfull boxes in lateximages.
- Fix: QED symbols in lateximage.

packages
- koma-script: Fix: Figure with \centering, etc.
- Added clrdblpg.

v0.54: Float `\centering`, improved image checks.

⚠ Reset the configuration

- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

lwarpmk

- `lwarpmk limages` checks for the presence of the HTML version of the document and valid image references before attempting to create the `lateximages`.
- *lwarpmk*: Improved error message if configuration file does not exist.

BibTeX

- Added documentation for avoiding error with BibTeX and `\etalchar`. See section 8.6.9.

polyglossia

- Added documentation regarding polyglossia. See section 8.15.4.

macros in section names

- Added documentation regarding the use of macros in section names. See section 8.1.

document encoding

⚠ New and revised encoding options

- Renamed and added package options:

Old Package Option	New Package Option
`xdyFilename`	`xindyStyle`
`IndexLanguage`	`xindyLanguage`
–	`xindyCodepage`
–	`pdftotextEnc`

  Use these options along with inputenc or inputenx to process documents in an encoding other than UTF-8. See section 7.4.

floats with `\centering`, etc.

- Floats now honor `\centering`, `\raggedright`, `\raggedleft`, and their ragged2e equivalents, when placed directly after:

```
\begin{floattype}
\centering
```

misc. fixes

- tikz: `\pgfpicture`, fit, align, font.
- ragged2e: `\centering` etc.
- hyperref: `\hypertarget` was creating duplicate of `\label`.
- hyperref: Active chars inside `\hyperref`, `\hyperlink`.
- hyperref: `\ref` inside `\hyperlink` caused a nested HTML link.
- glossaries: Fix when not using babel or polyglossia.
- textcomp: `\textperthousand`.
- LaTeX core `verse` environment: line spacing.

⚠

- Removed `\citetitle`, adjusted `\attribution`.

packages

- memoir: Minor update for v3.7g.
- Added inputenx, bibunits, chngpage, forest, magaz, gridset.
- Prevents loading ae, aecc, t1enc, and wasysym.

v0.53: Improved image checks.

lwarpmk

- *lwarpmk*: Added a warning about corrupted images due to the need to recompile the document one more time.
- *lwarpmk*: Added the **`lwarpmk cleanlimages`** command.
- Added documentation for **`lwarpmk cleanlimages`** and **`lwarpmk pdftohtml`**.

v0.52: Improved footnotes, SVG math.

documentation
- Improved install instructions regarding `lwarp_baseline_marker.png`.
- Added documentation regarding footnotes in section headings, and footnotes with `\VerbatimFootnotes` from fancybox, fancyvrb. See section 8.5.4.
- Added documentation regarding font selection when using XeLaTeX or LuaLaTeX with fontspec and traditional font packages. See section 7.4.

SVG math
- Fix: Limit the number of background tasks when generating `lateximages`.
- Added user-adjustable SVG math font scaling. See section 84.3.
- Added warnings if `lwarp_baseline_marker.png` is not present, or if graphicx or graphics is not loaded.
- Improved `\ensuremath` hashing expansion.
- Fix: `equation*` with `split`.
- `tabbing` now works inside a `lateximage`. Use for math in `tabbing`.

MathJax
- Fix: MathJax script was not executing in some conditions.
- Added `\CustomizeMathJax` to add custom functions. See section 8.7.

footnotes
- Fix: Footnote numbering when using `HTMLDebugComments`.
- Fix: Footnote paragraph tags.
- Fix: `FootnoteDepth` defaults to `\subsubsection`.

misc. fixes
- Fix: `\kill` in a `lateximage`.
- Fix: `\FileDepth`, misc. others, when input encoding is not `utf8`.
- Fix: `\texorpdfstring` in a section name.

packages
- hyperref emulation: Fix for #, %, &, ~, _ characters in URLs.
- fancybox, fancyvrb: Initial support for `\VerbatimFootnotes`.
- nicefrac: Added with fix for `\ensuremath`.
- graphicx: Fix for option defaults. Added v1.1a/b options.
- endfloat: Updated for v2.6.
- url: Fixes for active characters.

2 Introduction

The lwarp project aims to allow a rich LaTeX document to be converted to a reasonable HTML5 interpretation, with only minor intervention on the user's part. No attempt has been made to force LaTeX to provide for every HTML-related possibility, and HTML cannot exactly render every possible LaTeX concept. Where compromise is necessary, it is desirable to allow the print output to remain typographically rich, and compromise only in the HTML conversion.

Several "modern" features of HTML5, CSS3, and SVG are employed to allow a fairly feature-rich document without relying on the use of JavaScript. Limited testing on older browsers shows that these new features degrade gracefully.

---

lwarp is a native LaTeX package, and operates by either patching or emulating various functions. Source-level compatibility is a major goal, but occasional user intervention is required in certain cases.

As a package running directly in LaTeX, lwarp has some advantages over other methods of HTML conversion. TeX itself is still used, allowing a wider range of TeX trickery to be understood. Lua expressions are still available with LuaTeX. Entire categories of LaTeX packages work as-is when used with lwarp: definitions, file handling, utilities, internal data structures and calculations, specialized math-mode typesetting for various fields of science and engineering, and anything generating plain-text output. Blocks of PDF output may be automatically converted to SVG images while using the same font and spacing as the original print document, directly supporting Ti*k*z and `picture`. Numerous packages are easily adapted for HTML versions, either by loading and patching the originals, or by creating nullified or emulated replacements, and all without resorting to external programming. As a result, several hundred packages have already been adapted (table 2), and an uncounted number more work as-is.

Packages have been selected according to several criteria: perceived importance, popularity lists, recent CTAN updates, CTAN topics, mention in other packages, support by other HTML conversion methods, and from sample documents taken from public archives. These include some "obsolete" packages as well.[1]

Assistance is also provided for modifying the HTML output to suit the creation of EPUB documents, and for modifying the HTML output to ease import into a word processor.

---

pdflatex, *xelatex*, or *lualatex* may be used, allowing lwarp to process the usual image formats. While generating HTML output, SVG files are used in place of PDF. Other formats such as PNG and JPG are used as-is.

[1] An amazing number of decades-old packages are still in use today.

SVG images may be used for math, and are also used for `picture`, Ti*k*Z, and similar environments. The SVG format has better browser and e-book support than MathML (as of this writing), while still allowing for high-quality display and printing of images (again, subject to potentially bug-ridden[2] browser support).

Furthermore, SVG images allow math to be presented with the same precise formatting as in the print version. Math is accompanied by `<alt>` tags holding the LaTeX source for the expression, allowing it to be copy/pasted into other documents.[3] Custom LaTeX macros may be used as-is in math expressions, since the math is evaluated entirely inside LaTeX. An MD5 hash is used to combine multiple instances of the same inline math expression into a single image file, which then needs to be converted to SVG only a single time.

The MathJax JavaScript display engine may be selected for math display instead of using SVG images. Subject to browser support and Internet access, MathJax allows an HTML page to display math without relying on a large number of external image files.[4] lwarp maintains LaTeX control for cross-referencing and equation numbering, and attempts to force MathJax to tag equations accordingly.

A *texlua* program called *lwarpmk* is used to process either the print or HTML version of the document. A few external utility programs are used to finish the conversion from a LaTeX-generated PDF file which happens to have HTML5 tags, to a number of HTML5 plain-text files and accompanying images.

lwarp automatically generates the extra files necessary for the HTML conversion, such as CSS and `.xdy` files, and configuration files for the utility *lwarpmk*. Also included is a parallel version of the user's source document, `<sourcename>-html.tex`, which selects HTML output and then inputs the user's own source. This process allows both the printed and HTML versions to co-exist side-by-side, each with their own auxiliary files.

When requesting packages during HTML conversion, lwarp first looks to see if it has its own modified version to use instead of the standard LaTeX version. These `lwarp-packagename.sty` files contain code used to emulate or replace functions for HTML output.

[2] Firefox has had an on-again/off-again bug for quite some time regareding printing SVGs at high resolution.

[3] There seems to be some debate as to whether MathML is actually an improvement over LaTeX for sharing math. The author has no particular opinion on the matter, except to say that in this case LaTeX is much easier to implement!

[4] One SVG image file per math expression, except that duplicate inline math expressions are combined into a single file according to the MD5 hash function of its contents. A common scientific paper can easily include several thousand files, and in one case the MD5 hash cut the number of files in half and the rendering time by 30%.

2.1 Typesetting conventions

Font weight, family, and style are used to indicate various objects:

Table 1: Typesetting conventions

package	LaTeX package.
program	Program's executable name.
`option`	Program or package option.
`filename`	File name in the operating system.
Brand Name	Proper name for a program, operating system, etc.
`commands`	Commands to be entered by the user.
`code`	Program code.
`\macroname`	LaTeX macro.
`environment`	LaTeX environment.
`counter`	LaTeX counter.
`boolean`	LaTeX boolean.
`<element>`	HTML element.
`attribute`	HTML attribute.
User Interface	A user-interface item.
ACRO	Acronym.

subjects Blue-colored tags in the left margin aid in quickly identifying the subject of each paragraph. These are often the targets of index entries.

Prog Lwarp

index entries Black-colored tags in the left marign are used to identify programming objects such as files, packages, environments, booleans, and counters. Items without a tag are command macros. Each of these also appears in the index as individual entries, and are also listed together under "files", "packages", "environments", "booleans", and "counters".

⚠ warnings Special warnings are marked with a warning icon.

2.2 Supported packages and features

Table 2 lists some of the various LaTeX features and packages which may be used.

Package names are colored according to their support level:

name: Supported as-is.

name: Modifed to work with HTML output, and perhaps also as print output in SVG math or `latexmage` environments.

name: Emulated for HTML output.

name: Ignored for HTML output, but provides source-level compatibility.

MJ: Supported as-is for MathJax, subject to limitations.

MJ: Emulated for MathJax using custom macros, subject to limitations.

MJ: Ignored by MathJax, but may be used in the document source. May be converted to SVG images.

Table 2: LaTeX lwarp package — Supported features

3 Alternatives

Summarized below are several other ways to convert a LaTeX or other document to HTML. Where an existing LaTeX document is to be converted to HTML, lwarp may be a good choice. For new projects with a large number of documents, it may be worth investigating the alternatives before decided which path to take.

3.1 internet class

Cls internet

The closest to lwarp in design principle is the `internet` class by Andrew Stacey — an interesting project which directly produces several versions of markdown, and also HTML and EPUB. https://github.com/loopspace/latex-to-internet

3.2 TeX4ht

Prog TeX4ht

Prog htlatex

http://tug.org/tex4ht/

This system uses native LaTeX processing to produce a DVI file containing special commands, and then uses additional post-processing for the HTML conversion by way of numerous configuration files. In some cases lwarp provides a better HTML conversion, and it supports a different set of packages. TeX4ht produces several other forms of output beyond HTML, including ODT and a direct path to EPUB, and is still being developed.

3.3 Translators

These systems use external programs to translate a subset of LaTeX syntax into HTML. Search for each on CTAN (http:\ctan.org).

Prog Hevea

HeVeA: http://hevea.inria.fr/ (not on CTAN)

Prog TtH

TtH: http://hutchinson.belmont.ma.us/tth/

Prog GELLMU

GELLMU: http://www.albany.edu/~hammond/gellmu/

Prog LaTeXML

LaTeXML: http://dlmf.nist.gov/LaTeXML/

Prog Plastex

PlasTeX: https://github.com/tiarno/plastex

Prog LaTeX2HTML

LaTeX2HTML: http://www.latex2html.org/
and http://ctan.org/pkg/latex2html.

Prog TeX2page

TeX2page: http://ds26gte.github.io/tex2page/index.html

Finally, GladTeX may used to directly insert LaTeX math into HTML:

Prog GladTeX

GladTeX: http://humenda.github.io/GladTeX/

3.4 AsciiDoc and Asciidoctor

AsciiDoc is one of the most capable markup languages, providing enough features to produce the typical technical-writing document with cross-references, and it writes LaTeX and HTML.

Prog AsciiDoc

Asciidoctor: http://asciidoctor.org/ (More active.)

Prog AsciiDoctor

AsciiDoc: http://asciidoc.org/ (The original project.)

3.4.1 Asciidoctor-LaTeX

The Asciidoctor-LaTeX project is developing additional LaTeX-related features.

Asciidoctor-LateX:
http://www.noteshare.io/book/asciidoctor-latex-manual
Prog Asciidoctor-LaTeX
https://github.com/asciidoctor/asciidoctor-latex

3.5 Pandoc

Prog Pandoc

A markup system which also reads and writes LaTeX and HTML.

Pandoc: http://pandoc.org/

(Watch for improvements in cross-references to figures and tables.)

3.6 Word processors

Prog Word
Prog LibreOffice
Prog OpenOffice

It should be noted that the popular word processors have advanced through the years in their abilities to represent math with a LaTeX-ish input syntax, unicode math fonts, and high-quality output, and also generate HTML with varying success. See recent developments in Microsoft ® *Word* ® and LibreOffice ™ *Writer*.

3.7 Commercial systems

Prog Adobe
Prog FrameMaker
Prog InDesign
Prog Flare
Prog Madcap

Likewise, several professional systems exist whose abilities have been advancing in the areas of typesetting, cross-referencing, and HTML generation. See Adobe ® *FrameMaker* ®, Adobe *InDesign* ®, and Madcap *Flare* ™.

3.8 Comparisons

AsciiDoc, Pandoc, and various other markup languages typically have a syntax which tries to be natural and human-readable, but the use of advanced features tends to require many combinations of special characters, resulting in a complicated mess of syntax. By contrast, LaTeX spells things out in readable words but takes longer to type, although integrated editors exist which can provide faster

entry and a graphic user interface. For those functions which are covered by the typical markup language it is arguable that LaTeX is comparably easy to learn, while LaTeX provides many more advanced features where needed, along with a large number of pre-existing packages which provide solutions to numerous common tasks.

Text-based document-markup systems share some of the advantages of LaTeX vs. a typical word processor. Documents formats are stable. The documents themselves are portable, work well with revision control, do not crash or become corrupted, and are easily generated under program control. Formatting commands are visible, cross-referencing is automatic, and editing is responsive. Search/replace with regular expressions provides a powerful tool for the manipulation of both document contents and structure. Markup systems and some commercial systems allow printed output through a LaTeX back end, yielding high-quality results especially when the LaTeX template is adjusted, but they lose the ability to use LaTeX macros and other LaTeX source-document features.

The effort required to customize the output of each markup system varies. For print output, LaTeX configuration files are usually used. For HTML output, a CSS file will be available, but additional configuration may require editing some form of control file with a different syntax, such as XML. In the case of lwarp, CSS is used, and much HTML output is adjusted through the usual LaTeX optional macro parameters, but further customization may require patching LaTeX code.

The popular word processors and professional document systems each has a large base of after-market support including pre-designed styles and templates, and often include content-management systems for topic reuse.

4 Installation

Table 3 shows the tools which are used for the LaTeX to HTML conversion. In most cases, these will be available via the standard package-installation tools.

Detailed installation instructions follow.

Table 3: Required software programs

Provided by your LaTeX distribution:

From TeXLive: http://tug.org/texlive/.

LaTeX: *pdflatex*, *xelatex*, or *lualatex*.

The lwarp package: This package.

The *lwarpmk* utility: Provided along with this package. This should be an operating-system executable in the same way that *pdflatex* or *latexmk* is. It is possible to have the lwarp package generate a local copy of *lwarpmk* called `lwarpmk.lua`. See table 4.

***luatex*:** Used by the *lwarpmk* program to simplify and automate document generation.

***xindy*:** The *xindy* program is used by lwarp to create indexes. On a MiKTeX system this may have to be acquired separately, but it is part of the regular installer as of mid 2015.

***latexmk*:** Optionally used by *lwarpmk* to compile LaTeX code. On a MiKTeX system, *Perl* may need to be installed first.

***pdfcrop*:** Used to pull images out of the LaTeX PDF.

Poppler PDF utilities:

***pdftotext*:** Used to convert PDF to text.

***pdfseparate*:** Used to pull images out of the LaTeX PDF.

***pdftocairo*:** Used to convert images to SVG.

These might be provided by your operating-system package manager, and MiKTeX provides miktex-poppler-bin-* packages.

From Poppler: poppler.freedesktop.org.

For MacOS®, see https://brew.sh/, install *Homebrew*, then

Enter ⇒ **`brew install poppler`**

For Windows, see MikTeX miktex-poppler-bin-*, or:
https://sourceforge.net/projects/poppler-win32/ and:
http://blog.alivate.com.au/poppler-windows/

***Perl*:**

This may be provided by your operating-system package manager, and may be required for some of the Poppler PDF utilities.

strawberryperl.com (recommended), perl.org

Automatically downloaded from the internet as required:

MathJax: Optionally used to display math. From: mathjax.org

4.1 Installing the lwarp package

There are several ways to install lwarp. These are listed here with the preferred methods listed first:

Pre-installed: Try entering into a command line:

Enter ⇒ **`kpsewhich lwarp.sty`**

If a path to `lwarp.sty` is shown, then lwarp is already installed and you may skip to the next section.

TEX Live: If using a TEX Live distribution, try installing via *tlmgr*:

Enter ⇒ **`tlmgr install lwarp`**

MiKTEX:

1. For newer versions of MiKTEX, install or update lwarp using the *MiKTeX Console* program.
2. For older versions of MiKTEX, to install lwarp the first time, use the *MiKTeX Package Manager (Admin)*. To update lwarp, use *MiKTeX Update (Admin)*.
3. Either way, also update the package miktex-misc, which will install and update the *lwarpmk* executable.

Operating-system package: The operating-system package manager may already have lwarp, perhaps as part of a set of TEX-related packages.

CTAN TDS archive: lwarp may be downloaded from the Comprehensive TEX Archive:

1. See http://ctan.org/pkg/lwarp for the lwarp package.
2. Download the TDS archive: `lwarp.tds.zip`
3. Find the TEX `local` directory:

   TEX Live:

   Enter ⇒ **`kpsewhich -var-value TEXMFLOCAL`**

   MiKTEX:

   In the **Settings** window, **Roots** tab, look for a local TDS root.

   This should be something like:

   `/usr/local/texlive/texmf-local/`
4. Unpack the archive in the TDS local directory.
5. Renew the cache:

   Enter ⇒ **`mktexlsr`**

   — or —

   Enter ⇒ **`texhash`**

   Or, for WINDOWS MiKTEX, start the program called *MiKTeX Settings (Admin)* and click on the button called **Refresh FNDB**.

CTAN `.dtx` and `.ins` files: Another form of TEX package is `.dtx` and `.ins` source files. These files are used to create the documentation and `.sty` files.

1. See http://ctan.org/pkg/lwarp for the lwarp package.
2. Download the zip archive `lwarp.zip` into your own `lwarp` directory.
3. Unpack `lwarp.zip`.

4. Locate the contents `lwarp.dtx` and `lwarp.ins`
5. Create the `.sty` files:

   Enter ⇒ **`pdflatex lwarp.ins`**
6. Create the documentation:

```
pdflatex lwarp.dtx  (several times)
makeindex -s gglo.ist -o lwarp.gls lwarp.glo
makeindex -s gind.ist lwarp.idx
pdflatex lwarp.dtx  (several times)
```

7. Copy the `.sty` files somewhere such as the TEX Live local tree found in the previous CTAN TDS section, under the subdirectory:

   `<texlocal>/tex/latex/local/lwarp`
8. Copy `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` to the same place as the `.sty` files.
9. Copy the documentation `lwarp.pdf` to a `source` directory in the local tree, such as:

   `<texlocal>/doc/local/lwarp`
10. Renew the cache:

    Enter ⇒ **`mktexlsr`**

    — or —

    Enter ⇒ **`texhash`**

    Or, for WINDOWS MiKTEX, start the program called *MiKTeX Settings (Admin)* and click on the button called **Refresh FNDB**.
11. See section 4.2.1 to generate your local copy of *lwarpmk*.
12. Once the local version of `lwarpmk.lua` is installed, it may be made available system-wide as per section 4.2.

Project-local CTAN `.dtx` and `.ins` files: The `.dtx` and `.ins` files may be downloaded to a project directory, then compiled right there, alongside the document source files. The resultant `*.sty` and `lwarpmk.lua` files may be used as-is, so long as they are in the same directory as the document source. The files `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` must also be copied as well. This approach is especially useful if you would like to temporarily test lwarp before deciding whether to permanently install it.

Just testing!

4.2 Installing the *lwarpmk* utility

(Note: If *lwarpmk* is not already installed, it is easiest to use a local copy instead of installing it system-wide. See section 4.2.1.)

After the lwarp package is installed, you may need to setup the *lwarpmk* utility:

1. At a command line, try executing **`lwarpmk`**. If the *lwarpmk* help message appears, then *lwarpmk* is already set up. If not, it is easiest to generate and use a local copy. See section 4.2.1.
2. For MiKTEX, try updating the miktex-misc package. This may install the *lwarpmk* executable for you.

   Otherwise, continue with the following:

3. Locate the file `lwarpmk.lua`, which should be in the `scripts` directory of the TDS tree. On a TEX Live or MiKTEX system you may use

   Enter ⇒ **`kpsewhich lwarpmk.lua`**

   (If the file is not found, you may also generate a local copy and use it instead. See section 4.2.1.)

4. Create *lwarpmk*:

   Unix: Create a symbolic link and make it executable:

   (a) Locate the TEX Live binaries:

   Enter ⇒ **`kpsewhich -var-value TEXMFROOT`**

   This will be something like:

   `/usr/local/texlive/<year>`

   The binaries are then located in the `bin/<arch>` directory under the root:

   `/usr/local/texlive/<year>/bin/<architecture>/`

   In this directory you will find programs such as *pdflatex* and *makeindex*.

   (b) In the binaries directory, create a new symbolic link from the binaries directory to `lwarpmk.lua`:

   Enter ⇒ **`ln -s <pathtolwarpmk.lua> lwarpmk`**

   (c) Make the link executable:

   Enter ⇒ **`chmod 0755 lwarpmk`**

   WINDOWS TEX Live: Create a new `lwarpmk.exe` file:

   (a) Locate the TEX Live binaries as shown above for UNIX.

   (b) In the binaries directory, make a *copy* of `runscript.exe` and call it `lwarpmk.exe` This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

   WINDOWS MiKTEX: Create a new `lwarpmk.bat` file:

   (a) Locate the MiKTEX binaries. These will be in a directory such as:

   `C:\Program Files\MiKTeX 2.9\miktex\bin\x64`

   In this directory you will find programs such as `pdflatex.exe` and `makeindex.exe`.

   (b) Create a new file named `lwarpmk.bat` containing:

   ```
   texlua "C:\Program Files\MiKTeX 2.9\scripts\lwarp\lwarp.texlua" %*
   ```

   This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

4.2.1 Using a local copy of *lwarpmk*

It is also possible to use a local version of *lwarpmk*:

1. When compiling the tutorial in section 5, use the `lwarpmk` option for the lwarp package:

   ```
   \usepackage[lwarpmk]{lwarp}
   ```

2. When the tutorial is compiled with *pdflatex*, the file `lwarpmk.lua` will be generated along with the other configuration files.

3. `lwarpmk.lua` may be used for this project:

Unix:

(a) Make `lwarpmk.lua` executable:

Enter ⇒ **`chmod 0755 lwarpmk.lua`**

(b) Compile documents with

Enter ⇒ **`./lwarpmk.lua html`**

Enter ⇒ **`./lwarpmk.lua print`**

etc.

(c) It may be useful to rename or link to a version without the `.lua` suffix.

WINDOWS:

Compile documents with either of the following, depending on which command shell is being used:

Enter ⇒ **`texlua lwarpmk.lua html`**

Enter ⇒ **`texlua lwarpmk.lua print`**

etc.

Or:

Enter ⇒ **`lwarpmk html`**

Enter ⇒ **`lwarpmk print`**

etc.

4.3 Installing additional utilities

To test for the existence of the additional utilities:

Enter the following in a command line. If each programs' version is displayed, then that utility is already installed. See table 3 on page 76.

Enter ⇒ **`luatex --version`**

Enter ⇒ **`xindy --version`**

Enter ⇒ **`latexmk --version`**

Enter ⇒ **`perl --version`**

Enter ⇒ **`pdfcrop --version`**

Enter ⇒ **`pdftotext -v`**

Enter ⇒ **`pdfseparate --version`**

Enter ⇒ **`pdftocairo -v`**

To install *xindy*, *latexmk*, and *pdfcrop*:

The TEX utilities *xindy*, *latexmk*, and *pdfcrop* may be installed in *TexLive* with *tlmgr*, installed by *MiKTeX*, provided by your operating system's package manager, or downloaded from the *CTAN* archive:

http://ctan.org/pkg/xindy
http://ctan.org/pkg/latexmk
http://ctan.org/pkg/pdfcrop

Prog [requirement] `pdftotext`
Prog [requirement] `pdfseparate`
Prog [requirement] `pdftocairo`

To install the POPPLER utilities to a UNIX/LINUX system:

The tools from the POPPLER project should be provided by your operating system's package manager.

To install the POPPLER utilities to a MACOS machine:

1. Install *Homebrew* from https://brew.sh/:

Enter ⇒ **`/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"`**

2. Install the POPPLER utilities:
   Enter ⇒ `brew install poppler`

To install the POPPLER utilities to a WINDOWS machine:

If using MikTEX, install a miktex-poppler-bin-* package. Otherwise:

1. See table 3 on page 76.
2. Download and extract the POPPLER utilities *pdftotext*, *pdfseparate*, and *pdfseparate* to a directory, such as `Poppler`.
3. In the **Start** window, type "Path" to search for results related to Path. Or, open the control panel and search for "Path".
4. Choose **Edit the system environment variables** in the control panel.
5. Choose the **Environment Variables** button.
6. Choose the **Path** variable, then the **Edit** button.
7. Choose the **New** button to make an additional entry.
8. Enter the `bin` directory of the POPPLER utilities, such as:
   `C:\Users\<myname>\Desktop\Poppler\poppler-0.5_x86\poppler-0.5\bin`
   Be sure to include `\bin`.
9. Click **Ok** when done.

Prog [requirement] `perl`

To install PERL to a WINDOWS machine:

1. Download and install a version of PERL, such as STRAWBERRY PERL, to a directory without a space in its name, such as `C:\Strawberry`.
2. Edit the **Path** as seen above for the POPPLER utilities.
3. Enter the `bin` directory of the *perl* utility, such as:
   `C:\Strawberry\perl\bin`
   Be sure to include `\bin`.
4. Click **Ok** when done.

Any utilities installed by hand must be added to the PATH.

5 Tutorial

This section shows an example of how to create an lwarp document.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

5.1 Starting a new project

1. Create a new project directory called `tutorial`.

File `tutorial.tex`

2. Inside the `tutorial` directory, create a new file called `tutorial.tex`. This may be done several ways:

   Copy from the documentation PDF:

   A listing is in fig. 1, which may be copied/pasted from the figure directly into your own editor, depending on the quality of the PDF viewer and editor, or:

   Copy from the lwarp documentation directory:

File `lwarp_tutorial.txt`

⚠ Note: `.txt` suffix!

   Another copy may be found by entering into a command line:

   Enter ⇒ **`texdoc -l lwarp_tutorial.txt`**

   This should be in the `doc/latex/lwarp/` directory along with this PDF documentation. Copy `lwarp_tutorial.txt` directly into your `tutorial` directory, renamed as `tutorial.tex`.

⚠ Bad formatting!

   When using Windows, use an editor other than Notepad, since Notepad does not accept the end-of-line from a Unix text file.

3. Compile the project:

   Enter ⇒ **`pdflatex tutorial.tex`**

   (several times)

   (*xelatex* or *lualatex* may be used as well. lwarp also supports DVI *latex* for use with `.eps` images.)

4. View the resulting `tutorial.pdf` with a PDF viewer.

A number of new files are created when `tutorial.tex` is compiled, as shown in table 4. These files are created by the `lwarp` package.

(Two of the new files are configuration files for the helper program *lwarpmk*. Whenever a print version of the document is created, the configuration files for *lwarpmk* are updated to record the operating system, LaTeX engine (*latex*, *pdflatex*, *xelatex*, or *lualatex*), the filenames of the source code and HTML output, and whether the additional helper program *latexmk* will be used to compile the document.)

Table 4: Configuration files created by print version

tutorial.pdf: The PDF output from LaTeX. The print version of the document.

tutorial_html.tex: A small `.tex` file used to create a parallel HTML version of the document, which co-exists with usual the PDF version, and which will have its own auxiliary files. In this way, both PDF and HTML documents may co-exist side-by-side.

Auxiliary files: The usual LaTeX files `.aux`, `.log`, `.out`, `.toc`, `.lof`, `.idx`. When an HTML version of the document is created, `_html` versions of the auxiliary files will also be generated.

lwarpmk.conf: A configuration file for *lwarpmk*, which is used to automate the compilation of PDF or HTML versions of the document.

tutorial.lwarpmkconf: Another configuration file used by *lwarpmk*, which is only useful if you wish to have several projects residing in the same directory.

.css files: `lwarp.css`, `lwarp_formal.css`, `lwarp_sagebrush.css` These files are standard for lwarp, and are not meant to be modified by the user.

sample_project.css: An example of a user-customized CSS file, which may be used for project-specific changes to the lwarp defaults.

lwarp.ist: Used by lwarp while creating an index using *makeindex*. This file should not be modified by the user. A custom file may be used instead, if necessary.

lwarp.xdy: Used by lwarp while creating an index using *xindy*. This file should not be modified by the user. A custom file may be used instead, if necessary.

lwarp_one_limage.txt: For Windows only. Used to process SVG images in the background. Copied to `lwarp_one_limage.cmd` when images are generated.

lwarp_mathjax.txt: Inserted into the HTML files when MathJax is used to display math. Do not modify, see `\MathJaxFilename` instead.

comment_*.cut: Temporary files used by lwarp to conditionally process blocks of text. These files may be ignored.

When the `lwarpmk` option is given to the lwarp package:

lwarpmk.lua: A local copy of the *lwarpmk* utility.

On Unix-related operating systems this file must be made executable:

```
chmod u+x lwarpmk.lua
```

This may be useful to have to archive with a project for future use.

5.2 Compiling the print version with *lwarpmk*

The *lwarpmk* utility program is used to compile either the printed or the HTML version of the document.

`lwarpmk print` is used to recompile a printed version of the document.

⚠ Enable *lwarpmk*

1. If you have not yet done so, add `\usepackage{lwarp}` to the document, then compile the project a single time using *pdflatex*, *lualatex*, or *xelatex*. This generates the file `lwarpmk.conf`, which then allows the *lwarpmk* program to be used.

2. Re-compile the print version:

   Enter ⇒ **`lwarpmk print`**

   lwarpmk prints an introduction then checks to see if the document must be recompiled. If it seems that the files are up-to-date, then *lwarpmk* informs you of that fact and then exits.

3. Make a small change in the original document, such as adding a space character.

4. Recompile again.

   Enter ⇒ **`lwarpmk print`**

   The document is recompiled when a change is seen in the source. Several compilations may be necessary to resolve cross-references.

5. Force a recompile to occur.

   Enter ⇒ **`lwarpmk again`**

   Enter ⇒ **`lwarpmk print`**

   `lwarpmk again` updates the date code for the file, triggering a recompile the next time the document is made.[5]

6. Process the index.[6] [7]

   Enter ⇒ **`lwarpmk printindex`**

7. Recompile again to include the index.

   Enter ⇒ **`lwarpmk print`**

8. To force a single recompile when needed, even if no changes were detected:

   Enter ⇒ **`lwarpmk print1`**

Note that the HTML customization commands are ignored while making the print version.

[5] Although, when using the utility *latexmk* (introduced later), the changed date is ignored and an actual change in contents must occur to cause a recompile.

[6] The command **`lwarpmk printglossary`** is also available to process a glossary produced with the glossaries package. See section 8.6.12.

[7] Also see section 8.6.15 for index options.

5.3 Compiling the HTML version with *lwarpmk*

`lwarpmk html` is used to recompile an HTML version of the document.

⚠ Enable *lwarpmk*

1. If you have not yet done so, add `\usepackage{lwarp}` to the document, then compile the project a single time using *pdflatex*, *lualatex*, or *xelatex*. This generates the file `lwarpmk.conf`, which then allows the *lwarpmk* program to be used.

2. Compile the HTML version:

   Enter ⇒ **`lwarpmk html`**

   (a) *lwarpmk* uses LaTeX to process `tutorial_html.tex` to create `tutorial_html.pdf`.

   (b) *pdftotext* is then used to convert to the file `tutorial_html.html`. This file is a plain-text file containing HTML tags and content for the entire document.

   (c) *lwarpmk* manually splits `tutorial_html.html` into individual HTML files according to the HTML settings. For this tutorial, the result is `tutorial.html` (the home page), along with `First-chapter.html`[8], `Some-math.html`, and the document's index in `_Index.html`.[9]

3. View the HTML page in a web browser.

   Open the file `tutorial.html` in a web browser.

math images

   Note that math images have not yet been generated, so math is still displayed as its `alt` tag, which is set to the plain-text LaTeX source for that expression. Math may be displayed as SVG images (section 5.4) or by a MathJax script (section 5.5).

4. Force a recompile:

   Enter ⇒ **`lwarpmk again`**

   Enter ⇒ **`lwarpmk html`**

   Enter ⇒ **`lwarpmk print`**

5. Process the HTML index and recompile:[10][11]

   Enter ⇒ **`lwarpmk htmlindex`**

   Enter ⇒ **`lwarpmk html`**

   `_Index.html` is updated for the new LaTeX index.

6. Reload the web page to see the added index.

7. To force a single recompile when needed, even if no changes were detected:

   Enter ⇒ **`lwarpmk html1`**

[8] `First-chapter.html` also contains the first section, even though the second section is its own HTML page. This behavior is controlled by the boolean `CombineHigherDepths`.

[9] `index.html` is commonly used as a homepage, so the document index is in `_Index.html`.

[10] The command **`lwarpmk htmlglossary`** is also available to process a glossary produced with the glossaries package. See section 8.6.12.

[11] Also see section 8.6.15 for index options.

5.4 Generating the SVG images

math as SVG images

By default lwarp represents math as SVG images, with the LaTeX source included in `alt` attributes. In this way, the math is displayed as it was drawn by LaTeX, and the LaTeX source may be copied and pasted into other documents.

`picture` and Ti*k*z

lwarp uses the same mechanism for `picture` and Ti*k*z environments.

1. Create the SVG images:

   Enter ⇒ **`lwarpmk limages`**

   Enter ⇒ **`lwarpmk html`**

2. Move to the tutorial's HTML math page and reload the document in the browser.

3. The math images are displayed using the same font and formatting as the printed version.

4. Copy/paste a math expression into a text editor to see the LaTeX source.

⚠ adding/removing

When a math expression, `picture`, or Ti*k*z environment is added or removed, the SVG images must be re-created by entering **`lwarpmk limages`** to maintain the proper image-file associations. Inline SVG math may be hashed and thus not need to be recreated, but display math and objects such as Ti*k*z may move to new image numbers when the document is changed.

recompile first

Before attempting to create the SVG image files, *lwarpmk* verifies that the HTML version of the document exists and has correct internal image references.[12] If it is necessary to recompile the document's HTML version one more time, *lwarpmk* usually will inform the user with an error message, but there are some conditions which cannot be detected, so the user should watch for the LaTeX recompile warnings.

⚠ HTML instead of images

If HTML appears where an SVG image should be, recompile the document one more time to get the page numbers back in sync, then remake the images one more time.

⚠ page counter

Incorrect SVG images will also occur if the document changes the `page` counter:

```
\setcounter{page}{<value>}
```

The `page` counter must *not* be adjusted by the user.

⚠ Lots of files!

Expressing math as SVG images has the advantage of representing the math exactly as LaTeX would, but has the disadvantage of requiring an individual file for each math expression. For inline math, and some other objects, lwarp uses an MD5 hash on its LaTeX source to combine multiple instances of identical inline expressions into a single image file, but display math and other environments such as `picture` and Ti*k*z require one image file each. For a document with a large amount of math, see section 5.5 to use MathJax instead.

[12] This becomes important when dealing with a document containing thousands of images.

5.5 Using MathJax for math

math with MathJax

Math may also be represented using the MathJax JavaScript project.

1. In the tutorial's source code, uncomment the `mathjax` package option for lwarp:

   ```
   mathjax, % Use MathJax to display math.
   ```

2. Recompile

   Enter ⇒ **`lwarpmk html`**

3. Reload the math page.

⚠ MathJax requirements

MathJax requires web access unless a local copy of MathJax is available, and it also requires that JavaScript is enabled for the web page. The math is rendered by MathJax. Right-click on math to see several options for rendering, and for copying the LaTeX source.

While using MathJax has many advantages, it may not be able to represent complex expressions or spacing adjustments as well as LaTeX, and it may not support some math-related packages.

5.6 Changing the css style

For a formal css style, add to the preamble:

```
\usepackage{lwarp}
. . .
\CSSFilename{lwarp_formal.css}
. . .
\begin{document}
```

For a modern css style, `lwarp_sagebrush.css` is also provided:

```
\CSSFilename{lwarp_sagebrush.css}
```

See section 7.7 for more information about modifying the css styling of the document.

5.7 Customizing the HTML output

A number of settings may be made to control the HTML output, including filename generation, automatic compilation, math output, document splitting, meta data, and page headers and footers.

See section 7.6 for more information.

5.8 Using *latexmk*

latexmk is a LaTeX utility used to monitor changes in source files and recompile as needed.

1. In the tutorial's source code uncomment the `latexmk` option for the lwarp package:

   ```
   latexmk, % Use latexmk to compile.
   ```

2. Recompile the printed version of the document.

   Enter ⇒ **`lwarpmk print`**

   lwarp updates its own configuration files (`lwarpmk.conf` and `tutorial.lwarpmkconf`) whenever the printed version of the document is compiled. These configuration files remember that *lwarpmk* should use *latexmk* to compile the document.

3. Recompile the document.

   Enter ⇒ **`lwarpmk print`**

   and/or

   Enter ⇒ **`lwarpmk html`**

Changes are detected by comparing checksums rather than modification times, so `lwarpmk again` will not trigger a recompile, but *latexmk* has a much better awareness of changes than the *lwarpmk* utility does and it is likely to correctly know when to recompile. A recompile may be forced by making a small change to the source, and a single recompile may be forced with:

forced single-pass recompile

Enter ⇒ **`lwarpmk print1`**

and/or

Enter ⇒ **`lwarpmk html1`**

5.9 Using XeLaTeX or LuaLaTeX

XeLaTeX or LuaLaTeX may be used instead of LaTeX.

1. Remove the auxiliary files for the project:

   Enter ⇒ **`lwarpmk cleanall`**

2. Use *xelatex* or *lualatex* to compile the printed version a single time.

   Enter ⇒ **`xelatex tutorial.tex`**

   — *or* —

   Enter ⇒ **`lualatex tutorial.tex`**

   When the compile occurs, the configuration files for *lwarpmk* are modified to remember which TeX engine was used. XeLaTeX or LuaLaTeX will be used for future runs of *lwarpmk*.

3. To recompile the document:

   Enter ⇒ **`lwarpmk print`**

   -and-

   Enter ⇒ **`lwarpmk html`**

4. Also remember to update the indexes and recompile again:

   Enter ⇒ **`lwarpmk htmlindex`**

   Enter ⇒ **`lwarpmk html`**

   Enter ⇒ **`lwarpmk printindex`**

   Enter ⇒ **`lwarpmk print`**

5.10 Using DVI LaTeX

Traditional DVI LaTeX may also be used along with `.eps` image files. An SVG version of each image must also be provided. *lwarpmk* may be used to convert image formats.

To convert EPS files to PDF:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of files)**

To convert PDF files to SVG:

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of files)**

⚠ bitmapped fonts See section 7.4 regarding font selection to avoid the use of bitmapped fonts.

5.11 Using a glossary

lwarp supports the gloss and glossaries packages, although this tutorial does not supply an example.

5.11.1 gloss package

See section 8.6.11.

5.11.2 glossaries package

To process the glossary for the print version:

Enter ⇒ **`lwarpmk printglossary`**

⚠ (If **`makeglossaries`** is not found, see section 8.6.12.)

To process the glossary for the HTML version:

Enter ⇒ **`lwarpmk htmlglossary`**

In each case, the document will have to be recompiled afterwards:

Enter ⇒ **`lwarpmk html1`**

Enter ⇒ **`lwarpmk html`**

Enter ⇒ **`lwarpmk print1`**

Enter ⇒ **`lwarpmk print`**

See section 8.6.12 to set options for processing glossaries.

5.12 Cleaning auxiliary files

To remove the auxiliary files `.aux`, `.toc`, `.lof`, `.lot`, `.idx`, `.ind`, `.log`, and `.gl*`, and a few others:

Enter ⇒ **`lwarpmk clean`**

5.13 Cleaning auxiliary and output files

To remove the auxiliary files, and also remove the `.pdf` and `.html` files:

Enter ⇒ **`lwarpmk cleanall`**

5.14 Cleaning the images from the <project>-images directory

The `<project>-images` directory contains SVG images automatically generated for inline and display math, tikz, etc. To remove all the images from the `<project>-images` directory:

Enter ⇒ **`lwarpmk cleanlimages`**

5.15 Converting PDF or EPS images to SVG

HTML cannot display PDF or EPS images, so any external PDF graphics images must be converted to SVG format. *pdftocairo* and *epstopdf* may be used one image at a time, but *lwarpmk* also provides a way to convert PDF or EPS images in bulk:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of files)**

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of files)**

Be sure to always provide SVG files for HTML output.

5.16 Creating HTML from an incomplete compile

During testing it may be useful to finish the HTML conversion even when the document had errors and did not compile successfully. To attempt an HTML conversion of an incomplete document:

Enter ⇒ **`lwarpmk pdftohtml [-p project]`**

5.17 Processing multiple projects in the same directory

⚠ xr, xr-hyper, xcite

It is possible to have several projects in the same directory. *lwarpmk* has an optional parameter which is the document to compile.

To create each project:

Enter ⇒ **`pdflatex project_a`**

Enter ⇒ **pdflatex project_b**

Each project is given its own configuration file:

`project_a.lwarpmkconf, project_b.lwarpmkconf`

To compile each project with `lwarkmk`:

Enter ⇒ **lwarpmk print -p project_a**

Enter ⇒ **lwarpmk print -p project_b**

Enter ⇒ **lwarpmk html -p project_a**

Enter ⇒ **lwarpmk html -p project_b**

To generate each project's images:

Enter ⇒ **lwarpmk limages -p project_a**

Enter ⇒ **lwarpmk limages -p project_b**

To clean each project's images:

Enter ⇒ **lwarpmk cleanlimages -p project_a**

Enter ⇒ **lwarpmk cleanlimages -p project_b**

To clean each project's auxiliary files:

Enter ⇒ **lwarpmk cleanall -p project_a**

Enter ⇒ **lwarpmk cleanall -p project_b**

If using *bibtex*, for example, the HTML version must also be processed:

Enter ⇒ **bibtex project_a_html**

5.18 Using the *make* utility

lwarpmk has an action which may be useful for integration with the common *make* utility:

`lwarpmk pdftohtml [-p project]`

make may be used to compile the code to PDF with HTML tags (`project_html.pdf`), then *lwarpmk* may be used to convert each target to HTML files.

Title page, indexing, glossaries: See section 8.6, Front and back matter.

Shell escape: See section 7.3, Shell escape.

CSS customization: See section 7.7, Customizing the CSS.

MathJax customization: See section 8.7.6, Customizing MathJax.

Localization: (languages) — See section 7.1, Localization.

Accessibility: (`alt` and `title` tags) — See section 7.2, Accessibility.

Converting an existing document: See section 6, Converting an existing document.

EPUB conversion: See section 10, EPUB conversion.

Word processor conversion: See section 11, Word-processor conversion.

6 Converting an existing document

To convert an existing document for use with lwarp:

1. Arrange the document in the following order:
   (a) Declare the `\documentclass`.
   (b) Load text fonts.
   (c) Load inputenc or inputenx, fontenc, or fontspec.
   (d) Load lwarp.
   (e) Load remaining packages.
2. Modify the document:

⚠ math in section names

   (a) If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

⚠ scale

   (b) Avoid using the `\includegraphics` `scale` option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

   to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

⚠ tabular

   (c) Possible changes to `tabular` environments include: `*` columns, multirow, longtable, supertabular, xtab, bigdelim. See section 8.10.1.

⚠ package options

   (d) If using braces in package options, such as with caption, see section 8.1.
   (e) Possible option clashes with memoir. See section 8.13.

⚠ indexes

   (f) If using indexes, see section 8.6.15.
   (g) If using many indexes, glossaries, `.aux` files, etc., see section 8.6.15 regarding morewrites. If morewrites is already used, be sure to add the setup with `allocate=10`.
   (h) Other changes as per Special cases and limitations, section 8.
3. Convert any PDF images to SVG. See section 8.8.
4. Manually compile the print version with *latex*, *pdflatex*, *lualatex*, or *xelatex*.
5. `lwarpmk print` to finish the print version.
6. `lwarpmk html` to create the HTML version.
7. `lwarpmk limages` to create the SVG images of any SVG math, `lateximage`, Ti*k*z, etc.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

Table 5: Localization settings

Object names: LaTeX provides redefinable names for various objects, and lwarp adds a few more. Use `\renewcommand` to change these.

`\abstractname`: This macro is honored by lwarp.

`\linkhomename`: Displayed by the link to the homepage.

`\linkpreviousname`: Displayed by the link to the previous page

`\linknextname`: Displayed by the link to the next page.

`\sidetocname`: Displayed at the head of the sidetoc.

HTML settings: See table 8 and section 7.6 for details.

`\HTMLLanguage`: The language to declare for each web page.

`\ImageAltText`, `\MathImageAltText`, `\PackageDiagramAltText`, `\AltTextOpen`, `\AltTextClose`: The defaults used for HTML `alt` text for images. See section 7.2.

`\CSSFilename`: The name of the css file to use.

`\MathJaxFilename`: The name of the MathJax script to use.

Package options:

`ImagesName` and `ImagesDirectory`: These options control the filenames used by lwarp when it automatically generates images. See table 7 and section 7.5.

`xindyStyle`, `xindyLanguage`, `xindyCodepage`: When using *xindy*, these options may be set according to local use. See section 8.6.21.

`pdftotextEnc`: To adjust the encoding of *pdftotext*.

7 Additional details

7.1 Localization

Regional localization is supported by lwarp via the package options and macros shown in table 5.

7.2 Accessibility

lwarp provides several methods for improving access to the document using tools such as text-only browsers, copy / paste, text-to-speech readers, or Braille readers. lwarp can use the HTML `alt` text attribute for images, as describe below. lwarp can also use the HTML `title` attribute, which usually generates a pop-up text. lwarp can add this to a reference or hyperlink. lwarp also uses standard HTML5 elements which are pre-assigned ARIA roles for increased accessibility, and lwarp assigns the `math` role for SVG math images, and the `note` role for footnotes, end notes, margin paragraphs and notes, etc. MathJax also has provisions for improved accessibility as well. See table 6.

Table 6: Accessibiltiy settings

\ImageAltText: The default HTML `alt` text for `\includegraphics` and `lateximages`. Set with `\renewcommand`.

\includegraphics alt key: For `\includegraphics`, lwarp adds the `alt` key/value. For example:

```
\includegraphics[alt={Some text.}]{filename}
```

SVG math: For simple SVG math, lwarp places the LaTeX math expression in the `alt` text, so that the LaTeX expression may be copied and pasted to another document as plain text.

\MathImageAltText: For complicated SVG math, such as enclosed in `\InlineMathOther`/`\InlineMathNormal`, or `\DisplayMathOther`/`\DisplayMathNormal`, the HTML `alt` text will be set to `\MathImageAltText`. Set with `\renewcommand`.

MathJax: For MathJax, the accessibility tools provided by MathJax are enabled by default by lwarp's MathJax scripts.

\PackageDiagramAltText: Various packages create diagrams which lwarp converts into SVG images. These are given `alt` text set to `\PackageDiagramAltText`. Set with `\renewcommand`.

\ThisAltText: The HTML `alt` text of the next image may be set with:

```
\ThisAltText{Custom text about the image.}
<SVG math, Tikz, picture, etc.>
```

The next single image will be generated with the given text, and the following images will revert to back to their defaults.

`\ThisAltText` may also be used to assign an HTML `title` to the next reference or hyperlink.

```
\ThisAltText{Custom text about the link.}
Text ... \ref{label_name} ... text.
```

See section 7.6.

\AltTextOpen and \AltTextClose: By default, HTML `alt` text is enclosed by parentheses. This may be changed by redefining `\AltTextOpen` and `\AltTextClose`. Set with `\renewcommand`.

7.3 Shell escape

Opt `--shell-escape`

Some documents require the use of an external program, which is allowed when using the `--shell-escape` command-line option. When the document is first compiled manually, and also whenever the print version is recompiled, lwarp detects and remembers whether shell escape is enabled. If so, it will also be enabled when the document is recompiled with *lwarpmk*.

7.4 Font and UTF-8 support

⚠ type 3 bitmapped fonts

lwarp uses *pdftotext* to convert PDF output into UTF-8-encoded text. This process requires that UTF-8 information be embedded in the PDF file, which may prevent the use of older "type 3" bit-mapped fonts, and of older packages such as ae. The lwarp option `pdftotextEnc` may be useful in some situations. See section 7.5.

vector fonts
Computer Modern
⚠ *pdflatex*
⚠ DVI *latex*

While using DVI *latex* or PDF *pdflatex*, if no font-related package is specified then the default COMPUTER MODERN font is used, which may be a "type 3" bit-mapped font which may not convert well to plain text. A "type 1" vector font is required.

Pkg `cm-super`

To use the updated cm-super's type 1 fonts instead of Computer Modern, install the cm-super font package.

Pkg `lmodern`

To use Latin Modern instead, add

```
usepackage{lmodern}
```

to the preamble.

Pkg `dejavu`

Another useful option is the Deja Vu series of fonts, which have an increased coverage of language and glyphs:

```
\usepackage{dejavu}
```

latex, *pdflatex*, T1, UTF8

While using DVI *latex* or PDF *pdflatex*, lwarp automatically loads fontenc with T1 encoding. fontenc may be loaded with an additional encoding after lwarp. inputenc is automatically loaded with UTF8 encoding if if has not yet been loaded, but may also be specified with another encoding such as `latin1`. See the next section regarding index encoding.

⚠ *xelatex*, *lualatex*, fontspec

XeLaTeX and LuaLaTeX users must use the fontspec package. Do NOT use fontenc!

Place fontspec or fontenc, xunicode, and other font and UTF-8 related commands after the `\documentclass` command and before `\usepackage{lwarp}`.

⚠ package conflicts

In some cases, a package conflict may require that a font package be loaded after lwarp, which should work as well:

1. `documentclass{article/book/report}` comes first, followed by any of:
2. Font and UTF-8 related commands:
   - For XeLaTeX or LuaLaTeX:
     - fontspec and font choices

Pkg `fontspec`

ligatures

lwarp sets the following to turn off TeX ligatures during the generation of HTML tags, and turn off common ligatures in regular text,

since older browsers may not display them correctly and newer browsers can automatically re-create them.

```
\defaultfontfeatures[\rmfamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\sffamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\ttfamily]{Ligatures=NoCommon}
```

- For *pdflatex*:
  (a) `\usepackage{lmodern}`, or other font-related packages
  (b) `\usepackage[T1]{fontenc}`
  (c) `\usepackage[utf8]{inputenc}`, or `latin1`, etc. Or use inputenx.
  (d) `\usepackage{newunicodechar}` along with related definitions.
  (e) To assist with the PDF-HTML conversion:
    i. `\input glyphtounicode.tex`
    ii. `\input glyphtounicode-cmr.tex% from the pdfx package`
    iii. `\pdfgentounicode=1`
  (f) Another option to assist with the PDF-HTML conversion, such as the dotless j (`\j`):
    – `\usepackage{cmap}` — *or* —
    – `\usepackage{mmap}` — *or* —
    – `\usepackage[noTeX]{mmap}`
  (g) `\usepackage{textcomp}`

Pkg lmodern
Pkg fontenc
Pkg inputenc
Pkg inputenx
Pkg newunicodechar
File glyphtounicode.tex
⚠ dotless j
Pkg cmap
Pkg mmap
Pkg textcomp

3. `\usepackage{newtxmath}` or other math-related font packages. Many of these load amsmath, which may now be loaded before lwarp.
4. `\usepackage{lwarp}` (section 7.5) is placed after any of the above, followed by:
5. `\setmonofont{TeX Gyre Cursor}` or similar may be required if using XeLaTeX or LuaLaTeX and fontspec along with traditional font packages such as txfonts, newtxtext, etc. This is required to turn off the monospaced font's ligatures with fontspec after loading the traditional font packages. Monospaced output ligatures must be turned off to produce the correct HTML characters.

   ⚠ fontspec with monospaced fonts

   Any monospace font with built-in ligatures may require these ligatures to be disabled for HTML. In one example, JetBrain Mono, it is required to use

   ⚠ JetBrain Mono
   ⚠ HTML corrupted

   ```
   \setmonofont{JetBrains Mono}[%
   . . .
   Contextuals=AlternateOff,
   ]
   ```

   After lwarp is loaded, the ligature may be re-enabled for print mode by using `\setmonofont` again inside a `warpprint` environment.
6. … the rest of the preamble and the main document.

⚠ UTF-8 locale In some cases, an external program may require a UTF-8 "locale". See section 9.9.

7.4.1 Indexes, glossaries, and encoding

lwarp supports *makeindex*, *xindy*, *xindex*, and glossaries, gloss, and nomencl.

See section 8.6.14 for indexing, and section 8.6.12 for the glossaries package.

7.5 lwarp package loading and options

lwarp supports book, report, and article classes, as well as the equivalent Koma-script classes and memoir, and various CJK-related classes and packages.

Load the lwarp package immediately after the font and UTF-8 setup commands.

Package options may be set while loading lwarp, or later with

```
\lwarpsetup{⟨key=value, . . . ⟩}
```

Pkg `lwarp`

lwarp package options are as follows:

Opt `mathsvg`
Opt `mathjax`
Default: `mathsvg`

`mathsvg` and **`mathjax`:** Selects SVG images or MATHJAX for math display. See section 8.7.

Opt `latexmk`
Default: `false`

`latexmk`: Tells *lwarpmk* to use *latexmk* to recompile the document several times if necessary. Otherwise, *lwarpmk* attempts to determing for itself whether to recompile. See section 7.6.

Opt `dvips`
Default: `false`

`dvips`: Tells *lwarpmk* to use *dvips* and *ps2pdf* to convert DVI output to PDF.

Opt `dvipdfm`
Default: `false`

`dvipdfm`: Tells *lwarpmk* to use *dvipdfm* to convert DVI output to PDF.

Opt `dvipdfmx`
Default: `false`

`dvipdfmx`: Tells *lwarpmk* to use *dvipdfmx* to convert DVI output to PDF.

Opt `HomeHTMLFilename`
Default: `\BaseJobname`

`HomeHTMLFilename`:

Filename of the homepage, without the "`.html`" suffix. Defaults to the `\BaseJobname`. A common setting is:

```
HomeHTMLFilename=index
```

causing the homepage to be the file `index.html`. Underscores are allowed in `HomeHTMLFilename` and `HTMLFilename` options, but may need to be escaped elsewhere, such as when appearing in a list:

filename underscores

```
\item [\href{file\_name.pdf}{text}] \
```

See section 7.6.1 for examples of naming and numbering HTML files.

Opt `HTMLFilename`
Default: `<empty>`

`HTMLFilename`: A filename prefix for the rest of the HTML web pages. Useful for numbered web pages with a common prefix. May be empty. See section 7.6.1 for examples of naming and numbering HTML files.

Opt `ImagesName`
Default: `image-`

`ImagesName`: The prefix for the images automatically generated by lwarp for objects such as SVG math and `lateximages`.

Opt `ImagesDirectory`
Default: `\jobname-images`

`ImagesDirectory`: The directory for the images automatically generated by lwarp for objects such as SVG math and `lateximages`. By default, these images will appear in a directory named `<jobname>-images`, and the images will be named and numbered `image-<nn>`.

Table 7: Lwarp package options

Option	Description
mathsvg	Show math using SVG images.
mathjax	Show math using MATHJAX.
latexmk	Use *latexmk* for compiling documents.
dvips	Use *dvips* and *ps2pdf* to convert DVI documents.
dvipdfm	Use *dvipdfm* to convert DVI documents.
dvipdfmx	Use *dvipdfmx* to convert DVI documents.
HomeHTMLFilename	The filename of the home page.
HTMLFilename	A prefix for the filenames of the remaining web pages.
ImagesName	A prefix for the filenames of generated images.
ImagesDirectory	The directory used to hold generated images.
PrintLatexCmd	The shell commands for **lwarpmk print**.
HTMLLatexCmd	The shell commands for **lwarpmk html**.
For indexing (section 8.6.15) and glossaries (section 8.6.12):	
makeindex	Use *makeindex* to generate indices.
makeindexStyle	Set a custom style for *makeindex*.
xindy	Use *xindy* to generate indices.
xindyStyle	Set a custom style for *xindy*.
xindyLanguage	The *xindy* language option used for index generation.
xindyCodepage	The *xindy* codepage option used for index generation.
xindex	Use *xindex* to generate indices.
xindexConfig	Set a custom configuration file for *xindex*.
PrintIndexCmd	Shell commands executed by **lwarpmk printindex**.
HTMLIndexCmd	Shell commands executed by **lwarpmk htmlindex**.
LatexmkIndexCmd	Shell commands executed by *latexmk*.
IndexRef	How to format index links.
GlossaryCmd	Shell command executed by **lwarpmk printglossary** and **lwarpmk htmlglossary**.
Seldom necessary:	
OSWindows	Force compatibility with MS-WINDOWS.
pdftotextEnc	Set the encoding for *pdftotext*.
lwarpmk	Generate a local copy of `lwarpmk.lua`.
Used internally by lwarp:	
warpprint	Generate print output, and also generate configuration files.
warpHTML	Generate HTML output.
BaseJobname	The `\jobname` to use. Set to the `\jobname` of the printed version even while generating HTML.

Opt `PrintLatexCmd`
Default: `<automatic>`

`PrintLatexCmd:` Sets the shell commands executed by **`lwarpmk print`**. If not specified, will automatically be set according to the detected LaTeX engine and the use of `--shell-escape`.

Opt `HTMLLatexCmd`
Default: `<automatic>`

`HTMLLatexCmd:` Sets the shell commands executed by **`lwarpmk html`**. If not specified, will automatically be set according to the detected LaTeX engine and the use of `--shell-escape`.

Opt `makeindex`
Default: `makeindex`

`makeindex:` Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *makeindex* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*. If neither `makeindex` nor `xindy` is used, `makeindex` is assumed.

Opt `makeindexStyle`
Default: `lwarp.ist`

`makeindexStyle:` If you wish to use a custom `.ist` file for index generation, see section 8.6.20.

Opt `xindy`
Default: `makeindex`

`xindy:` Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *xindy* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*.

Opt `xindyStyle`
Default: `lwarp.xdy`

`xindyStyle:` If you wish to use a custom `.xdy` file for index generation, see section 8.6.21.

Opt `xindyLanguage`
Default: `english`

`xindyLanguage:` If using an index or glossary, see section 29.

Opt `xindyCodepage`
Default: `utf8`

`xindyCodepage:` If using an index, see section 29.

Opt `xindex`
Default: `makeindex`

`xindex:` Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *xindex* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*.

Opt `xindexConfig`
Default: `<empty>`

`xindexConfig:` If you wish to use a custom `xindex-*.lua` file for index generation, see section 8.6.22.

Opt `PrintIndexCmd`
Default: `<automatic>`

`PrintIndexCmd:` Sets the shell commands executed by **`lwarpmk printindex`**. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.

Examples:

```
makeindex -s lwarp.ist projectname.idx            (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname.idx   (xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `PrintIndexCmd` to sensible values for each of those programs while compiling a single index. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified.

⚠ xindy

If specifying `PrintIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `PrintIndexCmd` option when it is set manually.

This option is stored in the configuration files `lwarpmk.conf` and `*.lwarpmkconf`, and is then passed by the **`lwarpmk printindex`** command to the operating system to compile the print indexes. Since the command string is parsed by TEX, written to a file, read from the file by LuaTEX, and finally passed to the operating system, any attempt at quoting will be problematic. For complicated commands, it would be best to create a shell script, and simply refer to the script with the lwarp `PrintIndexCmd` option.

Opt `HTMLIndexCmd`
Default: `<automatic>`

`HTMLIndexCmd:` Sets the shell commands executed by **`lwarpmk htmlindex`**. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.

⚠ filenames

Example settings are similar to `PrintIndexCmd`, but append `_html` to the filenames:

```
makeindex -s lwarp.ist projectname_html.idx        (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname_html.idx
(xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `HTMLIndexCmd` to sensible values for each of those programs while compiling a single index. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified.

⚠ xindy

If specifying `HTMLIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `HTMLIndexCmd` option when it is set manually.

As with `PrintIndexCmd`, to generate complicated indexes it may be worthwhile to use a shell script, then refer to that script with `HTMLIndexCmd`.

Opt `LatexmkIndexCmd`
Default: `<automatic>`

`LatexmkIndexCmd:` Sets the shell commands executed by *latexmk*. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include any filenames, which will be provided instead by *latexmk*. See section 8.6.15.

Example settings are similar to `PrintIndexCmd`, but without a filename:

```
makeindex -s lwarp.ist                              (makeindex)
xindy -M lwarp.xdy -L english -C utf8                  (xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `LatexmkIndexCmd` to either of the two settings show above. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, *latexmk* uses either of the single-line settings of `LatexmkIndexCmd` shown above to compile each of multiple indexes if necessary.

⚠ xindy

If specifying `LatexmkIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `LatexmkIndexCmd` option when it is set manually.

Opt `IndexRef`
Default: `cref`

`IndexRef:` Describes how to display the index entries for HTML output. Possible values are `ref`, `nameref`, `refnameref`, `cref`, `crefnameref`, `autoref`, or a text string such as `(link)` or `(*)` for each index entry reference. (Adding parentheses around a single character makes the link larger and easier to click on.) The default is `cref`, which is available even if the print document does

not use cleveref, as the lwarp package relies on cleveref during HTML output. Option `autoref` gives the same results as `cref`.

`\ref` and `\cref` to starred or otherwise unknown links will display as `(*)` instead of ??.

⚠ ?? If using `cref` (the default), and if a reference appears as ?? with a non-functional link, use cleveref's `\crefname` to give a name to that type of label.

In general, `crefnameref` gives the most information, but the index can become quite verbose. Using `(*)` or similar yields a very compact index.

Opt `GlossaryCmd` Default: **`makeglossaries`**

`GlossaryCmd`: Sets the shell command executed by **`lwarpmk printglossary`** and **`lwarpmk htmlglossary`**. The print or HTML glossary filename is appended to this command. See section 8.6.12.

Opt `OSWindows`

`OSWindows`: lwarp attempts to automatically sense WINDOWS, but it may be forced with this option. See section 7.9.

Opt `pdftotextEnc` Default: `UTF-8`

`pdftotextEnc`: Used to specify the encoding used by *pdftotext* during the PDF-HTML conversion. In most situations, the default is the correct choice.

Opt `lwarpmk`

`lwarpmk`: If you wish to have lwarp generate a local copy of `lwarpmk.lua` for archival or local-installation purposes, compile the print version with the `lwarpmk` option set. See section 29.

The following options are used internally by lwarp, and usually are not used in the user's document:

Opt `warpprint`
Opt `warpHTML`

`warpprint` and **`warpHTML`:** Usually controlled by *lwarpmk*, and not set in the document. Select the `warpprint` option to generate print output (default), or the `warpHTML` option to generate HTML5 output. The default is print output, so the print version may be compiled with the usual *pdflatex*, etc. When lwarp is loaded in print mode, it creates `<project>_html.tex`, which sets the `warpHTML` option before calling the user's source code `<project>.tex`. In this way, `<project>.tex` can `\usepackage{lwarp}` without any options to create a printed version, while `<project>_html.tex` will create an HTML version.

Opt `BaseJobname` Default: `\jobname`

`BaseJobname`: Not intended for the user. Used internally by lwarp when creating the `*_html.tex` file used to compile the HTML version. See section 29.

7.6 Customizing the HTML output

Table 8 shows several settings may be used to customize the HTML output. Watch for the correct placement of each!

⚠ Placement!

⚠ Changes! Note that if changes are made, it is best to first:

1. Clear all the HTML, PDF, and auxiliary files:

   Enter ⇒ **`lwarpmk clearall`**

2. Recompile the print version in order to recreate the configuration files for *lwarpmk*:

   Enter ⇒ **`lwarpmk print`**

3. Finally, recompile the HTML version with the new settings:

   Enter ⇒ **`lwarpmk html`**

Placed in the preamble before `\begin{document}`:

`\HTMLFirstPageTop` Default: <empty>

`\HTMLFirstPageTop`: {⟨*contents*⟩} A user-definable custom action applied to the top of the home page. Useful for logos, etc. `\LinkNext` may be used to link to the next web page. Defaults empty. Ignored in print output.

`\HTMLFirstPageBottom` Default: <empty>

`\HTMLFirstPageBottom`: {⟨*contents*⟩} A user-definable custom action applied to the bottom of the home page. Useful for logos, etc. `\LinkNext` may be used to link to the next web page. Defaults empty. Ignored in print output.

`\linkhomename` Default: Home

`\linkhomename`: Name of the link to the home page. Paragraphs are allowed. Redefine with `\renewcommand`.

`\linkpreviousname` Default: Previous

`\linkpreviousname`: Name of the link to the previous page. Paragraphs are allowed. Redefine with `\renewcommand`.

`\linknextname` Default: Next

`\linknextname`: Name of the link to the next page. Paragraphs are allowed. Redefine with `\renewcommand`.

Ctr `tocdepth`

`tocdepth`: Sectioning depth of the table of contents. See section 16 for a list of LaTeX stack depths.

Ctr `SideTOCDepth` Default: 1

`SideTOCDepth`: Sectioning depth of the sideTOC. Defaults to 1, causing the sideTOC to show sections but not subsections.

sideTOC

Each subpage of the website has its own small table of contents on the side (the "sideTOC"). Its depth is set by `SideTOCDepth`. This sideTOC is only shown if the browser display is wide enough. When using a narrow web browser window, "responsive web design" is used to show the sideTOC at the top of the page, as well as a link back to **Home** at the top and bottom.

It is recommended to set:

```
SideTOCDepth=FileDepth
```

or

Table 8: HTML settings

Macro/Cntr/Bool	Loc*	Description
\linkhomename	P	Name of the link to the homepage.
\linkpreviousname	P	Name of the link to the previous page.
\linknextname	P	Name of the link to the next page.
SideTOCDepth	P	Sectioning depth of the sideTOC.
\sidetocname	P	Name of the sideTOC.
FileDepth	P	Sectioning depth of the file splits.
CombineHigherDepths	P	Combine higher section levels.
FileSectionNames	P	Use section names for file names, else use numbers.
\FilenameLimit	P	Maximum length of the generated filenames.
FootnoteDepth	P	Sectioning depth of footnotes.
\abstractname	P	The name of the abstract.
\ImageAltText	PD	\includegraphics and other images' alt tag.
\ThisAltText {⟨text⟩}	PD	Assigns an alt/title tag for the next image or link.
\MathImageAltText	PD	The SVG math image lateximage alt tag.
\PackageDiagramAltText	PD	The suffix for a package's lateximage alt tags.
\AltTextOpen	PD	Start an HTML alt tag.
\AltTextClose	PD	End an HTML alt tag.
\CSSFilename	PS	The CSS for the following files.
\MathJaxFilename	PS	The MATHJAX script for the following files.
\HTMLLanguage	PS	The HTML lang tag.
\HTMLTitle	PS	The homepage's <title>, overriding \title.
\HTMLTitleBeforeSection	PS	Set subpage <title>s to \HTMLTitle - sectionname
\HTMLTitleAfterSection	PS	Set subpage <title>s to sectionname - \HTMLTitle
\HTMLAuthor	PS	The HTML author meta tag, overriding \author.
\HTMLDescription	PS	The HTML description meta tag.
\HTMLFirstPageTop	P	Heading for the home page.
\HTMLFirstPageBottom	P	Footer for the home page.
\HTMLPageTop	PS	Heading for the other pages.
\HTMLPageBottom	PS	Footer for the other pages.
\HTMLnewcolumntype	D	\newcolumntype for HTML.
\IndexPageSeparator	P	Index page list separator.
\IndexRangeSeparator	P	Index page range separator.
FixSmallCaps	P	Set true if small caps rendered as all caps.
HTMLDebugComments	P	Boolean to generate HTML comments.

* **P:** Preamble, **D:** Anywhere in the document. **S:** Before a section.

SideTOCDepth = FileDepth+1

⚠ inaccessible pages

If SideTOCDepth < FileDepth, web pages will be inaccessible via the sideTOC.

\sidetocname
Default: Contents

\sidetocname: Name of the sideTOC. Paragraphs are allowed. Redefine with \renewcommand.

Ctr FileDepth
Default: -5

FileDepth: Sectioning depth of file splits. Defaults to -5, causing the entire HTML website to be one single file.

- To place the entire file into one HTML page, use:
  \setcounter{FileDepth}{-5}
- To split the HTML file at \section depth, use:
  \setcounter{FileDepth}{1}
- To ensure that the HTML pages/files are accessible:
  Place a \tableofcontents somewhere before the first section break (therefore in the "home page"), and set
  tocdepth >= FileDepth

⚠

Bool CombineHigherDepths
Default: true

CombineHigherDepths: Combine a higher section with its first lower subsections, down to the FileDepth. Defaults to true. Set to false to simulate the concept of a chapter opening on its own page, for example.

The file splits are controlled by the counter FileDepth and the boolean CombineHigherDepths. Setting FileDepth to 0 splits the file at chapters, 1 at sections, etc. CombineHigherDepths controls whether to combine pages at levels higher than the chosen FileDepth, such as in this tutorial where the page which opens the chapter also contains the first section. Be careful to set tocdepth and SideTOCDepth to allow access to each page of the website. Set tocdepth and SideTOCDepth to be greater than or equal to FileDepth.

⚠ Inaccesible pages!

⚠ Lost in an old page!

When making changes to the file structure, it is possible to end up with the web browser pointing to an old file which is no longer in use. When this occurs, changes to the web site will not appear in the browser, even if reloading the page, because that page is no longer in use. It is best to return to the home page, clean the files (lwarpmk cleanall), change FileDepth and/or CombineHigherDepths, then finally recompile and renavigate to the desired page using the new file structure.

Bool FileSectionNames
Default: true

FileSectionNames: If true, web page filenames are derived from a sanitized version of the section names. If false, web pages are numbered. Either way, the HTMLFilename option is used as a prefix. See section 7.6.1 for examples of naming and numbering HTML files. The user must ensure that filenames are unique after begin sanitized. For example, math in the section name is removed before creating the filename, so the rest of the filename must be sufficiently unique to avoid name collisions.

⚠ Unique filename!

\FilenameLimit
Default: 80

\FilenameLimit: The maximum length of the filenames generated by lwarp. ".html" is added to this length. Redefine with \renewcommand.

Ctr FootnoteDepth
Default: 3

FootnoteDepth: Determines where to place pending footnotes. 3 places footnotes before each break down to the \subsubsection level. 1 places footnotes before each \section break. Any pending footnotes are also placed at the bottom of each page before each file break.

Bool FixSmallCaps
Default: false

FixSmallCaps: Set true if SMALL CAPS are rendering in all caps ("SMALL

CAPS"). May be required for some fonts (erewhon, utopia, fbb, et al.), and packages such as embrac.

Bool HTMLDebugComments
Default: false

HTMLDebugComments: Set true to generate HTML comments, such as which section or is being opened or closed.

\abstractname
Default: Abstract

\abstractname: The name of the abstract. This may also be over-written by the babel package. Defaults to "Abstract". Redefine with \renewcommand.

\IndexPageSeparator
Default: ", "

\IndexPageSeparator: Index page list separator. Adjust to match index style file. If using gindex, this is set automatically to gindex's \indexpagessep.

\IndexRangeSeparator
Default: "--"

\IndexRangeSeparator: Index page range separator. Adjust to match index style file. If using gindex, this is set automatically to gindex's \indexrangesep.

Placed before \begin{document}, or before any sectioning command which causes a file break:

\CSSFilename
Default: lwarp.css

\CSSFilename: {⟨*filename.css*⟩} Sets the CSS file to use for the following files. May be changed before each each sectioning command which would cause a file split.

The CSS styles of the web pages are set by the \CSSFilename command. If \CSSFilename is not used, a default plain style is used to mimic printed LaTeX output. lwarp_sagebrush.css is a semi-fancy colored style as shown in this tutorial. Change it to lwarp_formal.css for a more formal look, or comment out the \CSSFilename command to see the default. \CSSFilename may be used before each file break to set the CSS for individual pagess of the website.

\MathJaxFilename
Default: lwarp_mathjax.txt

\MathJaxFilename: {⟨*filename*⟩} Sets the MathJax script file to use for the following files. May be changed before each each sectioning command which would cause a file split.

The MathJax script file is copied into the head of each HTML file. This may be used to point to a local repository, add extensions, or change the script somewhere in the middle of the document. \MathJaxFilename may be used before each file break to set the script file for individual pages of the website.

\HTMLLanguage
Default: en-US

\HTMLLanguage: {⟨*langauge*⟩} The HTML file's HTML lang meta tag. Defaults to en-US.

\HTMLTitle
Default: \thetitle

\HTMLTitle: {⟨*title*⟩} Overrides \title for the HTML header's meta title. Defaults to \thetitle, which is set by \title, or empty otherwise. Unlike the author, \thetitle is set by \title even if not using the titling package.

\HTMLTitleBeforeSection
Default: \HTMLTitleBeforeSection

\HTMLTitleBeforeSection: Sets subpage <title> tags to show the website title followed by the section name.

\HTMLTitleAfterSection

\HTMLTitleAfterSection: Sets subpage <title> tags to show the section name followed by the website title.

custom <title>

To customize subpage <title>s, redefine \theHTMLTitleSection, which defaults to:

```
\def\theHTMLTitleSection{%
  \theHTMLTitle\theHTMLTitleSeparator\theHTMLSection%
}
```

\HTMLAuthor
Default: \theauthor

\HTMLAuthor: {⟨*author*⟩} The HTML header's meta author. Defaults to \theauthor, which is set by \author if using the titling package, but is empty otherwise. There are several ways to represent the author and affiliations, especially if using the authblk package, most of which do not result in a sensible \theauthor, so \HTMLAuthor is useful to create a list of authors without their affiliations.

\HTMLDescription
Default: <empty>

\HTMLDescription: {⟨*description*⟩} Sets the HTML description tag for the following files. May be changed before each each sectioning command which would cause a file split.

\HTMLPageTop
Default: <empty>

\HTMLPageTop: {⟨*contents*⟩} A user-definable custom action applied to the top of pages other than the home page. Useful for logos, etc. Defaults empty. \LinkHome may be used to place a link back to the homepage, as well as \LinkPrevious and \LinkNext. Ignored in print output.

\HTMLPageBottom
Default: <empty>

\HTMLPageBottom: {⟨*contents*⟩} A user-definable custom action applied to the bottom of pages other than the home page. Useful for authors, copyright notices, contact information, etc. Defaults empty. \LinkHome may be used to place a link back to the homepage, as well as \LinkPrevious and \LinkNext. Ignored in print output.

\LinkHome

\LinkHome: Creates a link to the home page. Usually used in \HTMLPageTop and related.

\LinkPrevious

\LinkPrevious: Creates a link to the previous HTML page, unless already at the home page. Usually used in \HTMLPageTop and related.

\LinkNext

\LinkNext: Creates a link to the next HTML page, unless already at the end. Usually used in \HTMLPageTop and related.

Placed in the home page before the first sectioning command which causes a file break:

\tableofcontents
⚠ TOC on the homepage!

\tableofcontents: Used to place a table of contents on the home page. This command must be used before the first file split, so that a way is available to navigate to other files from the homepage.

Links to each chapter/section are provided, as selected by tocdepth.

Placed in the document wherever necessary:

\ImageAltText
Default: image

\ImageAltText: Redefine with \renewcommand. \includegraphics and other images are assigned an HTML alt tag according to \ImageAltText along with \AltTextOpen and \AltTextClose. This text is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "image", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following \includegraphics and other images.

\ThisAltText

\ThisAltText: {⟨*text*⟩} \ThisAltText can be used to assign an HTML alt text attribute to the next image generated by a lateximage, picture, tikzpicture, or any other similar environment which generates an image, or the next SVG math expression. This tag is cleared after use. The tag is also cleared after each MATHJAX expression, in case the user changes between SVG math and MATHJAX.

\ThisAltText also may be used to add an HTML title to a reference or hyperlink, such as a \ref, \cref, \href, \url, \hyperref, or \hyperlink. In each case, the alternative text is cleared after use.

\MathImageAltText
Default: math image

\MathImageAltText: Redefine with \renewcommand. When creating an SVG math image, its HTML alt tag may be set to the math expression, which may be hashed for image reuse. In the case of \ensuremath or after \inlinemathother, where the contents require a unique image for each instance of the same expression, the alt tag is set to \MathImageAltText, along with \AltTextOpen and \AltTextClose, and the image is not reused.

This alt expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "math image", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following SVG math images.

\PackageDiagramAltText
Default: diagram

\PackageDiagramAltText: Redefine with \renewcommand. For many packages, the output is placed inside a lateximage with an HTML alt tag set to the package name followed by \PackageDiagramAltText. For example:

```
(-xy- diagram)
```

This expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "diagram", and may it be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following package diagrams.

\AltTextOpen
Default: (

\AltTextOpen: Redefine with \renewcommand.

\AltTextClose
Default:)

\AltTextClose: Redefine with \renewcommand. HTML alt text is enclosed by the macros \AltTextOpen and \AltTextClose, which default to an opening and closing parenthesis.

\HTMLnewcolumntype

\HTMLnewcolumntype: \newcolumntype may not always work with lwarp for HTML output, since it often involves TEX boxes and fills. To provide a simplified column type for HTML, add \HTMLnewcolumntype in addition.

Env warpprint

warpprint: An environment which is only used while generating print output. Place inside anything which does not apply to HTML and which may cause problems with lwarp. If lwarp knows about and emulates or supports a package then its related macros, lengths, counters, etc. probably won't have to be placed inside a warpprint environment, but unknown packages may cause problems which may be isolated from lwarp using this environment.

⚠ *Do not place anything else on the same line as* \end{warpprint}. Also do not nest warpprint inside itself.

Env warpHTML

warpHTML: An environment which is only included while generating HTML output. This is useful for website logos and other items which have no purpose in printed output.

⚠ *Do not place anything else on the same line as* \end{warpHTML}. Also do not nest warpHTML inside itself.

\warpprintonly

\warpprintonly: {⟨*contents*⟩} A macro version of the warpprint environ-

ment.

\warpHTMLonly **\warpHTMLonly:** {⟨*contents*⟩} A macro version of the warpHTML environment.

7.6.1 Example HTML file naming

Examples of ways to name or number HTML files:

Numbered HTML nodes:

Example: Homepage index.html, and node-1, node-2. [13]

```
\usepackage[
    HomeHTMLFilename=index,
    HTMLFilename={node-}
]{lwarp}
\boolfalse{FileSectionNames}
```

Named HTML sections, no prefix:

Example: index.html, and About.html, Products.html

```
\usepackage[
    HomeHTMLFilename=index,
    HTMLFilename={}
]{lwarp}
\booltrue{FileSectionNames}
```

Named HTML sections, with prefix:

Example: Homepage mywebsite.html, and additional pages such as mywebsite-About.html, mywebsite-Products, etc.

```
\usepackage[
    HomeHTMLFilename=mywebsite,
    HTMLFilename={mywebsite-}
]{lwarp}
\booltrue{FileSectionNames}
```

7.7 Customizing the CSS

\CSSFilename {⟨*filename*⟩}
Default: lwarp.css

\CSSFilename may be used to choose which .css file is used to display each page of the web site. Use \CSSFilename before \begin{document} to assign the style of the home page. If different parts of the website should have different styles, call \CSSFilename again before each section heading which creates a new file. This may be changed numerous times throughout the file, resulting in different HTML pages having different CSS files assigned:

[13] See \SetHTMLFileNumber to number in groups by chapter, for example.

```
...
\CSSFilename{myCSS.css}
\chapter{Another Chapter}
...
```

The styles provided by lwarp include:

lwarp.css: A default style if \CSSFilename is not used. This style is comparable to a plain LaTeX document. To set this style, you may use \CSSFilename{lwarp.css}, or no \CSSFilename call at all.

lwarp_formal.css: A formal style with a serif fonts and a traditional look.

lwarp_sagebrush.css: A style with muted colors, gradient backgrounds, additional borders, and rounded corners.

To see each style in use, change the \CSSFilename entry in the tutorial, lwarpmk html again, and then reload the tutorial webpage.

Custom css

A customized style may also be created. For each new project a file called sample_project.css is generated. This may be renamed to <project>.css then used by assigning \CSSFilename{<project>.css}.

⚠ Rename it!

Note that sample_project.css is overwritten whenever lwarp is loaded in print mode. It is therefore important to rename the file to something like <project>.css before using it, so that your own changes are not overwritten.

<project>.css has an entry which loads lwarp.css, and this entry may be changed to load lwarp_formal.css or lwarp_sagebrush.css if desired. Additional changes to the CSS may be made by making entries later in the <project>.css file.

File lwarp.css
File project.css
File sample_project.css

It is best to make a local project-specific CSS file such as project.css, containing only things which are different from lwarp.css. The file project.css should refer to lwarp.css as follows:

```
/* ( --- Start of project.css --- ) */
/* ( --- A sample project-specific CSS file for lwarp --- ) */

/* Uncomment one of the following: */
@import url("lwarp.css") ;
/* @import url("lwarp_formal.css") ; */
/* @import url("lwarp_sagebrush.css") ; */

/* Project-specific CSS setting follow here. */
/* . . . */

/* ( --- End of project.css --- ) */
```

Finally use \CSSFilename{<project>.css} in the document to activate the custom CSS.

7.8 Assigning css classes and styles

HTML CSS classes and styles may be assigned to fragments of the document.

Env BlockClass

[⟨*style*⟩] {⟨*class*⟩}

An entire block of text, including paragraphs, may be assigned a css class and optional css style using the BlockClass environment. The result is placed inside a . A BlockClass may nest other BlockClasses or \InlineClasses.

\InlineClass

(⟨*wp css style*⟩) [⟨*web css style*⟩] {⟨*css class*⟩} {⟨*text*⟩}

A section of text without paragraphs may be assinged a css class and optional css style using the \InlineClass macro. The result is placed inside a . \InlineClass may be nested, but per the HTML standard it must not contain BlockClass, nor may it contain a paragraph, nor several other objects such as HTML figures. \InlineClass also accepts a second optional parameter, enclosed inside parentheses, which assigns the style while generating output for a word processor, while ignoring the web style.

Nullified versions of BlockClass and \InlineClass are provided for the print version, so they may be used in the document without placing them inside warpHTML or \warpHTMLonly.

7.9 Selecting the operating system

Prog Unix
Prog Mac OS
Prog Linux
Prog MS-Windows
Prog Windows
Opt OSWindows

lwarp tries to detect which operating system is being used. UNIX / MAC OS / LINUX is the default (collectively referred to as "UNIX" in the configuration files), and MS-WINDOWS is supported as well.

If MS-WINDOWS is not correctly detected, use the lwarp option OSWindows.

When detected or specified, the operating-system path separator used by lwarp is modified, and the boolean usingOSWindows is set true. This boolean may be tested by the user for later use.

7.10 Selecting actions for print, HTML, or MATHJAX output

The following environments and macros are used to select actions which only apply to either traditional LaTeX print-formatted PDF generation, or to HTML generation, or to HTML with MATHJAX.

For most of built-in LaTeX and many additional packages there is user-level source code support or emulation, so no special handling will be required. For those cases which lwarp does not handle by itself, the following environments and macros may be used to isolate sections of code for print-only or HTML-only.

These environments are also useful for creating a special version of the titlepage for print and another for HTML.

Env warpHTML

Anything which is to be done only for HTML5 output is surrounded by a warpHTML environment:

```
\begin{warpHTML}
 ... something to be done only during \HTML\ generation
\end{warpHTML}
```

⚠ \end{warpHTML}
⚠ nesting

Do *not* place anything else on the same line as \end{warpHTML}. The exact phrase is used to mark the end of the environment. Do not nest warpHTML inside itself. warpMathJax may be used inside warpHTML.

Env warpprint

Anything which is to be done only for print output is surrounded by a warpprint environment:

```
\begin{warpprint}
 ... something to be done only during traditional \PDF\ generation
\end{warpprint}
```

⚠ \end{warpprint}
⚠ nesting

As above, do not place anything else on the line with \end{warpprint}. Do not nest warpprint inside itself.

Env warpall

Anything which is to be done for any output may be surrounded by a warpall environment. Doing so is optional.

```
\begin{warpall}
 ... something to be done during print \PDF\ or \HTML\ output
\end{warpall}
```

⚠ \end{warpall}
⚠ nesting

As above, do not place anything else on the line with \end{warpall}. Do not nest warpall inside itself.

Macros are also provided for print-only or HTML-only code:

\warpprintonly {⟨*actions*⟩}

Performs the given actions only when print output is being generated.

\warpHTMLonly {⟨*actions*⟩}

Performs the given actions only when HTML output is being generated.

Env warpMathJax

⚠ \end{warpMathJax}
⚠ nesting

Anything which is to be done only while using HTML output with MathJaxis surrounded by a warpMathJax environment. Usually, this is \CustomizeMathJax, used to add emulation macros. \end{warpMathJax} must appear on its own line. Do not nest warpMathJax inside itself. warpMathJax may be used inside warpHTML.

Env warpsvg

⚠ \end{warpsvg}
⚠ nesting

Anything which is to be done only while using print output or HTML output with SVG math is surrounded by a warpsvg environment. \end{warpsvg} must appear on its own line. Do not nest warpsvg inside itself. warpsvg may be used inside warpHTML.

\LWR@formatted

To define macros or environments which behave differently depending on print or HTML output, see section 36.

7.11 Commands to be placed into the warpprint environment

Certain print-related commands should always be placed inside a warpprint environment, or may need other special handling. These are unrelated to HTML output, but are hard to isolate automatically. For example:

- Paragraph formatting: `\parindent` `\parskip`
- Manual page positions such as the textpos package, which is emulated but only in a limited way.
- Anything changing the page counter. lwarp requires that the page counter not be adjusted during HTML output.

Some packages require additional setup commands. Where these packages are emulated for HTML, setup commands may work for the emulated HTML output as well as for print output. See the details for each package in this document for more information.

Also see section 13: Troubleshooting.

7.12 Title page

In the preamble, place an additional block of code to set the following:

```
\title{Document Title} % One line only
\author{Author One\affiliation{Affiliation One} \and
    Author Two\affiliation{Affiliation Two} }
\date{Optional date}
```

The title is used in the meta tags in the HTML files, unless overridden by `\HTMLTitle`, and the rest are used in `\maketitle`. To use a `\subtitle` or `\published` field, see section 69.8.

`\maketitle`

Use `\maketitle` just after the `\begin{document}`, as this will establish the title of the homepage. Optionally, use a `titlepage` environment instead.

Env `titlepage`

The `titlepage` environment may be used to hold a custom title page. The titlepage will be set in a `<div>` class `titlepage`, and `\printtitle`, etc. may be used inside this environment.

Env `titlingpage`

Another form of custom title page, where `\maketitle` is allowed, and additional information may be included as well.

`\title` {⟨*title*⟩}

⚠ HTML corrupted ⚠ newlines

Avoid newlines in the `\title`; these will interfere with the file break and CSS detection. Use a `\subtitle` command instead (section 69.8). The title will appear in the document `\maketitle` as a heading `<h1>`. The HTML meta `title` tag will also have this title, unless `\HTMLTitle` is used to set the meta title to something else instead.

`\author` {⟨*author*⟩}

In `\author`, `\protect` may be needed before some formatting commands. In HTML, the author will appear in a `<div>` of class `author` in the `\maketitle`. If the titling package is used, the author will also appear in a HTML meta tag, but `\HTMLAuthor` may be necessary to create a plain list of names if `\author` had affiliations added. `\affiliation` is a new addition to lwarp.

`\date` {⟨*date*⟩}

`\date` works as expected. In HTML, this will appear in a `<div>` class `titledate`.

`\thanks` {⟨*text*⟩}

`\thanks` are allowed in the titlepage fields, and will be rendered as HTML notes at the bottom of the title page.

7.13 HTML page meta descriptions

`\HTMLDescription` {⟨*A description of the web page.*⟩}
Default: (none)

limitations Each page of HTML output should have its own HTML meta description, which usually shows up in web search results, is limited to around 150 characters in length, and should not include the ASCII double quote character (").

placement Use `\HTMLDescription` just before `\begin{document}` to set the description of the home page, and also just before each sectioning command such as `\chapter` or `\section` where a new file will be generated, depending on `FileDepth`. For example, if `FileDepth` is 1, use `\HTMLDescription` just before each `\section` command, and that description will be placed inside the HTML page for that `\section`. The same descrition will be used for all following HTML files as well, until reset by a new `\HTMLDescription`. It is best to use a unique description for each HTML file.

disabling To disable the generation of HTML description meta tags, use:

```
\HTMLDescription{}
```

7.14 HTML homepage meta title

`\HTMLTitle` {⟨*title*⟩}
Default: `\HTMLtitle{\thetitle}`

Sets the contents of the web page `<meta name="title">` element. May be set empty to cancel the meta title tag.

See section 7.6 for `\HTMLTitleBeforeSection` and `\HTMLTitleAfterSection`, used to set the title for HTML subpages.

7.15 HTML page meta author

`\HTMLAuthor` {⟨*author*⟩}
Default: `\HTMLAuthor{\theauthor}`

Sets the contents of the web page `<meta name="author">` element. May be set empty to cancel the meta author tag.

`\author` may be used to create a list of authors and their affiliations, in several formats if using authblk, and these may not successfully parse properly into a sensible list for `\theauthor`. `\HTMLAuthor` may be used to set the meta tag to a simple list of names.

8 Special cases and limitations

Some commonly-used LaTeX expressions should be modified as follows to allow for a smooth conversion to both HTML and print-formatted outputs.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

8.1 Things to avoid

In the document, avoid the following:

⚠ options with braces

Package options: Package options may cause problems with lwarp, especially if they include curley braces.

If selecting options with braces in `\usepackage` does not work:

```
\usepackage[font={it,small}]{caption}% does not work
```

... try instead selecting the package options before loading lwarp:

```
\PassOptionsToPackage{font={it,small}}{caption}
...
\usepackage{lwarp}
...
\usepackage{caption}
```

... or try setting package options after the package has been loaded:

```
\usepackage{caption}
\captionsetup{font={it,small}}
```

page counter: Do not adjust the page counter. If doing so is required for the print version, place the adjustment inside a `warpprint` environment.

Custom math environment macros: Do not use expressions such as `\beq` as a replacement for `\begin{equation}`.

Custom macros in section, figure, table names: Custom macros which appear in sectioning commands or float captions then appear in the `.toc`, `.lof`, and `.lot` lists, and should be made robust using `\newrobustcmd` or `\robustify` from etoolbox, xparse, etc.

When setting `FileSectionNames` to `true` to name the HTML files from the section names, the file names are created from sanitized versions of the chapter or section names, but the section names must be plain text or something which expands into plain text. Robust macros will not work at the sectioning level which is used for file names, but a robust macro or other complicated name may be used for the manditory argument of `\chapter`, `\section`, etc., if a plain-text version is also included in the optional argument:

```
\chapter[Plain Name]{\ARobustMacro{Fancy Name}}
```

8.1.1 Invalid HTML

Additionally, some objects are valid LaTeX, but invalid HTML. An example is a tabular inside `\textbf`, since HTML does not allow a table inside a span. lwarp

will create the table, and the browser may support it, but the result is technically invalid.

8.2 Formatting

8.2.1 Text formatting

⚠ `\bfseries`, etc. `\textbf`, etc. are supported, but `\bfseries`, etc. work only in some situations.

⚠ HTML special chars &, <, and > have special meanings in HTML. If `\&`, `\textless`, and `\textgreater` are used, proper HTML entities will be used, but there may be HTML parsing problems if these special characters occur unescaped in program listings or other verbatim text.

program listings For program listings, the listings package is supported, and its `literate` option is used to convert &, <, and > to proper HTML entities.

verbatim The various `verbatim`-related environments do not convert &, <, and >, so care must be taken to avoid accidentally including valid HTML code inside these environments. Adding a space on either side may be sufficient.

8.2.2 Small caps

`Bool FixSmallCaps` Some fonts, such as erewhon, utopia, or fbb, and some packages such as embrac, copy/paste "Small Caps" as all caps ("SMALL CAPS"), which lwarp then reads as all caps, so the text is printed in all caps. If small caps are being rendered as all caps, set:

```
\booltrue{FixSmallCaps}
```

⚠ CJK fonts Some CJK fonts may not work if `FixSmallCaps` is set `true`.

8.2.3 Horizontal and vertical space and rules

`\hspace` `\hspace` is converted to an inline HTML span of the given width, except that `0` width is ignored, a width of `.16667em` is converted to an HTML thin breakable space (`U+2009`), and a `\fill` is converted to a `\qquad`.

`\vspace` `\vspace` is ignored for HTML.

`~` `\,` `~` and `\,` are converted to HTML entities.

`\kern` `\hskip` `\kern` and `\hskip` are entered into the HTML PDF output as-is, then interpreted by *pdftotext*, and thus usually appear as a single space.

`\rule` `\rule` is converted to an HTML rule of the same dimensions, of the currently selected text color.

`\hrule` `\vrule` Both `\hrule` and `\vrule` are ignored for HTML. To create a horizontal dividing rule across the page, use `\hrulefill` in its own paragraph.

`\hrulefill` `\hrulefill` usually creates a one-inch rule, similar to a "fill in the blank". If it

is used at the start of a new paragraph, it creates a with a thin horizontal border across the page, as would often be done with \hrule.

8.2.4 Text alignment

Use the environments center, flushright, flushleft instead of the macros \centering, \raggedright, \raggedleft.

⚠ figure & table alignment

\centering, etc. are honored in a figure or table if they are the first command inside the float:

```
\begin{table*}
\centering
\caption{A Table}
. . .
```

8.2.5 Accents

Native LaTeX accents such as \" will work, but many more kinds of accents are available when using Unicode-aware XeLaTeX and LuaLaTeX. If using accents in section names which will become file names, it is recommended to use the LaTeX accents such as \" and \v instead of Unicode accents. The LaTeX accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

8.2.6 textcomp package

Pkg textcomp

Some textcomp symbols do not have Unicode equivalents, and thus are not supported.

⚠ missing symbols

Many textcomp symbols are not supported by many system / browser fonts. In the css try referencing fonts which are more complete, but expect to see gaps in coverage.

8.2.7 Superscripts and other non-math uses of math mode

Use ^{x} instead of ^{x}

8.2.8 Empty \item followed by a new line of text or a nested list:

lists

Use a trailing backslash: \item[label] \

8.2.9 Filenames and URLs in lists or footnotes

filename underscore

Escape underscores in the filenames:

```
\item[\href{file\_name.pdf}{text}]
```

8.2.10 relsize package

Pkg relsize

For HTML, only the inline macros are supported: \textlarger, \textsmaller, and \textscale. Each becomes an inline span of a modified font-size.

\relsize, \larger, \smaller, and \relscale are ignored.

While creating SVG math for HTML, the original definitions are temporarilty restored, and so should work as expected.

⚠ not small

The HTML browser's setting for minumum font size may limit how small the output will be displayed.

8.3 Boxes and minipages

8.3.1 Marginpars

\marginpar

[⟨*left*⟩] {⟨*right*⟩} \marginpar may contains paragraphs, but in order to remain inline with the surrounding text lwarp nullifies block-related macros inside the \marginpar. Paragraph breaks are converted to <br /> tags.

\marginparBlock

[⟨*left*⟩] {⟨*right*⟩} To include block-related macros, use \marginparBlock, which takes the same arguments but creates a instead of a . A line break will occur in the text where the \marginBlock occurs.

8.3.2 Save Boxes

⚠ HTML corrupted

⚠ boxes

TEX boxes are placed inline and do not allow line breaks, so boxes with long contents may overflow the line during HTML conversion. lwarp uses methods which help avoid this problem.

⚠ minipage, \parbox

\savebox and related do not (yet) support minipage or \parbox.

8.3.3 Minipages

⚠ inline

A line of text with an inline minipage or \parbox will have the minipage or \parbox placed onto its own line, because a paragraph is a block element and cannot be made inline-block.

placement

minipages and \parboxes will be placed side-by-side in HTML unless you place a \newline between them.

side-by-side

Side-by-side minipages may be separated by \quad, \qquad, \enskip, \hspace, \hfill, or a \rule. When inside a center environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side minipages and these spacing commands, but not at the start or end of the paragraph.

⚠ minipage in a span

There is limited support for minipages inside an HTML . An HTML cannot appear inside a . While in a , minipages, and \parboxes, and any enclosed lists have limited HTML tags, resulting in an "inline" format, without markup except for HTML breaks. Use \newline or \par for an HTML break.

⚠ minipage size

When using `minipage`, `\parbox`, and `fminipage`, a virtual 6×9 inch text area is used for `\linewidth`, `\textwidth`, and `\textheight`, both for sizing the minipage, and also for its contents.

if width is `\linewidth`

If a `minipage` or `\parbox` is assigned a width of exactly `\linewidth`, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it appears in print output.

full-width if HTML

A new macro `\minipagefullwidth` requests that, during HTML output, the next single `minipage` or `\parbox` be generated without an HTML `width` attribute, allowing it to be the full width of the display rather than the declared print-output width. This may be useful where the printed version's width makes no sense in HTML.

⚠ `tabular`, `multicols`

`\UseMinipageWidths`
`\IgnoreMinipageWidths`

Inside a `tabular` or `multicols` environment, where the width depends on the browser window, `\minipagefullwidth` is effectively used by default for every `minipage` or `\parbox` inside the environment. `\UseMinipageWidths` may be used to tell lwarp to honor the specified widths of all following `minipages` and `\parboxes` until the end of the local scope, and `\IgnoreMinipageWidths` may be used to tell lwarp to ignore the specified widths.

⚠ multicol

Inside a `multicols`, `\linewidth` is divided by the specified number of columns.

⚠ text alignment

Nested `minipages` adopt their parent's text alignment in HTML, whereas in regular LaTeX PDF output they do not. Use a `flushleft` or similar environment in the child `minipage` to force a text alignment.

8.3.4 Side-by-side minipages

Place side-by-side minipages inside a `center` environment, with horizontal space between them, such as `\quad`, `\qquad`, `\hspace`, or `\hfill`. The result is similar in print and HTML. Do not use space commands at the start or end of the line.

8.3.5 Framed minipages and other environments

`\fbox` can only be used around inline `<span>` items during HTML output, but HTML cannot place a block element such as a `<div>` for a minipage or a list inside of a `<span>`. Several options are provided for framing an object, depending on which kind of object and which packages are loaded:

`\fbox`
`\fboxBlock`
`Env fminipage`

For a framed object, options include:

To remove the frame in HTML output: Place the `\fbox` command and its closing brace inside `warpprint` environments. This will nullify the frame for HTML output.

For inline text:

To frame the contents inline with some formatting losses in HTML: This is the default action of `\fbox` when enclosing a minipage. During HTML output, `\fbox` nullifies the HTML tags for `minipage`, `\parbox`, and lists. The contents are included as inline text inside the `\fbox`'s `<span>` of class `framebox`. For lists, line breaks are converted to HTML breaks. The result is a plain-text inline version of the contents, framed inline with the surrounding text, but lacking any extra HTML markup.

For inline `minipage` and lists:

To frame the contents on their own line with improved formatting in HTML: A new command `\fboxBlock` is included, intended to be a direct replacement

for \fbox for cases where the \fbox surrounds a minipage, table, or list. For print output, this behaves as \fbox. For HTML output, the contents are placed inside an HTML with the class framed, resulting in the contents being placed on their own line with a frame surrounding them. The contents preserve their HTML formatting, so lists and minipages look nicer, and valid HTML is created for a tabular. While an \fbox containing a tabular is valid LaTeX code, the result in HTML is problematic since a table is a not a , so use \fboxBlock around a tabular, or else place the tabular inside a minipage, or use fminipage, described next. Also see below regarding the "Misplaced alignment tab character &." error.

For display tabular, minipages, and lists:

To create a framed minipage in both print and HTML: A new environment fminipage is included. For print output, this is identical to minipage, except that it is also framed. For HTML output, this forms a of class framed, the contents preserve their HTML formatting, and valid HTML is created for a tabular. Also see section 89 for a new environment fcolorminipage. Also see below regarding the "Misplaced alignment tab character &." error.

colored boxes and frames:

To create colored frames and boxes: See section 671 for xcolor's \colorbox and \fcolorbox, and lwarp's additional \colorboxBlock and \fcolorboxBlock.

⚠ Misplaced alignment tab character &

To frame tables or verbatim environments: Place the contents inside a fminipage, or perhaps a \fboxBlock for a tabular. Also, if using \fboxblock with tabular, you will have to use \StartDefiningTabulars before the start of the macro which uses \fboxBlock and the tabular, and \StopDefiningTabulars afterwards. Also see the lwarp documentation for the fancybox package.

To frame equations: See section 259 for the fancybox package.

For fancy framed minipages: See packages boxedminipage, shadow, fancybox, framed, mdframed.

Custom environments: Use a custom environment to create a sidebar, containing a BlockClass environment with custom CSS formatting, and \warpprintonly{\hrule} command:

```
\begin{BlockClass}{frameminipage}% ignored in print output
  % use \CSS\ to format div class framedminipage
\warpprintonly{\hrule} % only appears in print output
Contents
\warpprintonly{\hrule} % only appears in print output
\end{BlockClass}
```

8.3.6 fancybox package

Pkg fancybox

framed equation example

fancybox's documentation has an example FramedEqn environment which combines math, \Sbox, a minipage, and an \fbox. This combination requires that the entire environment be enclosed inside a lateximage, which is done by adding \lateximage at the very start of FramedEqn's beginning code, and \endlateximage at the very end of the ending code. Unfortunately, the HTML alt attribute is not used here.

```
\newenvironmentFramedEqn
{
\lateximage% NEW
\setlength{\fboxsep}{15pt}
. . . }{. . .
\[\fbox{\TheSbox}\]
\endlateximage% NEW
}
```

framing alternatives

`\fbox` works with fancybox. Also see lwarp's `\fboxBlock` macro and `fminipage` environment for alternatives to `\fbox` for framing environments.

framed table example

The fancybox documentation's example of a framed table using an `\fbox` containing a `tabular` does not work with lwarp, but the `FramedTable` environment does work if `\fbox` is replaced by `\fboxBlock`. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a `fminipage` environment. The caption may be placed either inside or outside the `fminipage`:

```
\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
. . .
\end{tabular}
\end{fminipage}
\end{table}
```

⚠ framed verbatim

lwarp does not support the `verbatim` environment inside a span, box, or fancybox's `\Sbox`, but a `verbatim` may be placed inside a `fminipage`. The fancybox documentation's example `FramedVerb` may be defined as:

```
\newenvironment{FramedVerb}[1] % width
{
  \VerbatimEnvironment
  \fminipage{#1}
  \beginVerbatim
}{
  \endVerbatim
  \endfminipage
}
```

framed `\VerbBox`

fancybox's `\VerbBox` may be used inside `\fbox`.

indented alignment

`LVerbatim`, `\LVerbatimInput`, and `\LUseVerbatim` indent with horizontal space which may not line up exactly with what *pdftotext* detects. Some lines may be off slightly in their left edge.

8.3.7 mdframed package

Pkg `mdframed`

support

Most basic functionality is supported, including frame background colors and single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for mdframed environments and frame titles.

⚠ loading

When used, lwarp loads mdframed in HTML with `frametheme=none`.

font

For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the mdframed source). Since lwarp does not support `\bfseries` and friends, only one font selection may be made at a time.

theoremtitlefont

`theoremtitlefont` is not supported, since the following text is not in braces in the mdframed source.

ignored options

`userdefinedwidth` and `align` are currently ignored.

css classes

Environments created or encapsulated by mdframed are enclosed in a `<div>` of class `mdframed`, and also class `md<environmentname>` for new environments.

Frame titles are placed in a `<div>` of class |mdframedtitle|. Subtitles are in a `<div>` of class |mdframedsubtitle|, and likewise for subsubtitles.

8.3.8 tcolorbox package

Pkg tcolorbox

tcolorbox is emulated for HTML and MathJax, and supported as-is inside a `lateximage` or SVG math.

What has been tested to work (at least partly) includes:

- `tcolorbox`, `\tcbox`.
- Title, subtitle.
- Upper, lower parts.
- Colors and title fonts.
- Floating objects.
- Some layered box features.
- Counters, labels, references.
- listings, listingsutf8.
- `theorems`: Theorems are supported. `math`, `ams equation`, etc. are not supported. Use a `tcolorbox` with regular math inside it. `\tcboxmath` and `\tcbhighmath` are suppored in SVG math, and emulated in MathJax.

⚠ math

- Fitting features: `\tcboxfit` becomes `\tcbox` in HTML.

⚠ footnotes

- Footnote numbering does not match the printed output.
- MathJax emulation is provided for common macros.

⚠ undefined references

If using cleveref, it may be necessary to name theorems such as:

```
\crefname{tcb@cnt@mytheo}{my theorem}{my theorems}
```

8.4 Section names

If using named HTML files, by selecting `\booltrue{FileSectionNames}`, the generated filenames may be simplified by using `\FilenameSimplify` and `\FilenameNullify`:

`\FilenameSimplify` {⟨*text*⟩}

To remove common short words from the automatically-generated filenames, replacing each with a single hyphen "-", use \FilenameSimplify:

```
\FilenameSimplify*{-in-}
\FilenameSimplify*{A-}
```

The first example removes the word "in" in the middle of a filename, and the second example removes "A" at the start of the filename. The star forces the arguments to be detokenized, which is required for a plain-text comparison. (The unstarred form is used for a token-sensitive comparison, which is seldom required by the user.) After simplfication, repeated hyphen characters will be further simplified to a single hyphen "-". Finally, single hyphens at the start or end of the filename are removed.

\FilenameNullify {⟨*macros*⟩}

⚠ macros in section names

Macro names may appear in the automatically-generated file names. To remove these, create *non-robust* nullified versions of the macros, ensuring that each line ends with a percent character % as shown below. These are placed inside \FilenameNullify, which adds them to the list of macros which are nullfiied during filename generation. Low-level macros such as \begingroup will cause problems when nullfied. Many macros such as \textbf are already nullfied. lwarp also already nullifies built-in symbol and textcomp macros, including if defined by xunicode, but not all xunicode macros. See the definition of \LWR@nullfonts for a complete list.

```
\FilenameNullify{%
  \renewcommand*{\macroname}[1]{#1}%
  \renewcommand*{\anothermacro}{}%
}
```

⚠ duplicate filename

Avoid duplicate file names. Section names at levels which result in HTML file splits must be unique. lwarp will generate an error if a duplicate HTML filename is generated. Use the optional TOC caption entry parameter for formatting. Remember to \protect LaTeX commands which appear in section names and TOC captions.

⚠ math in section names

If using named HTML files, in section names use paren math \(x+y\) instead of dollar math $x+y$. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use \texorpdfstring from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

8.5 Cross-references

labels
⚠ label characters

Labels with special characters may be a problem. It is best to stick with alphanumeric, hyphen, underscore, and perhaps the colon (if not French).

\nameref
⚠ empty link

\nameref refers to the most recently-used section where the \label was defined. If no section has been defined before the \label, the link will be empty. Index entries also use \nameref and have the same limitation.

8.5.1 Page references

⚠ LaTeX page numbers

The printed page does not translate to the HTML page, so `\pageref` references are converted to parentheses containing `\pagerefPageFor`, which defaults to "see ", followed by a hyperlink to the appropriate object.

Ex:

```
\ref{sec:name} on page \pageref{sec:name}
```

in HTML becomes:

"Sec. 1.23 on page (**see** sec. 1.23)".

`\pagerefPageFor` may be redefined to "page for ", empty, etc. See page 498.

8.5.2 cleveref and varioref packages

Pkg `cleveref`

Pkg `varioref`

⚠ cleveref page numbers

cleveref and varioref are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for `\cpageref` and `\cpagerefrange`. This phrase includes `\cpagerefFor`, which defaults to "for".

Ex:

```
\cpageref{tab:first,tab:second}
```

in html becomes:

"pages **for** table 4.1 and **for** table 4.2"

See `\cpagerefFor` at page 730 to redefine the message which is printed for page number references.

⚠ varioref types

cleveref changes the behavior of varioref in that the reference type is automatically printed if cleveref is loaded. Lwarp requires cleveref, so the HTML version will always automatically print the reference types even if the print mode does not. The simplest way to make them match is to require the cleveref package for the document.

8.5.3 Hyperlinks, hyperref, and url

Pkg `hyperref`

Pkg `url`

⚠ comments between arguments

lwarp emulates hyperref, including the creation of active hyperlinks, but does not require that hyperref be loaded by the document.

Do not place a comment with a `%` character between arguments for `\hyperref`, etc., as it is neutralized for inclusion in HTML URLs.

lwarp can also load url, but url should not be used at the same time as hyperref, since they both define the `\url` command. lwarp does not (yet) attempt to convert url links into hyperlinks during HTML output, nor does the print version of url create hyperlinks.

⚠ backref

When generating HTML, lwarp's emulation of hyperref does not automatically load backref, so backref must be loaded explicitly.

8.5.4 Footnotes, endnotes, and page notes

lwarp uses native LaTeX footnote code, although with its own \box to avoid the LaTeX output routine. The usual functions mostly work as-is.

footnote numbering

To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For bigfoot, manyfoot, or perpage:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by FootnoteDepth, which is not necessarily by HTML page. This is recommended for \alph, \Alph, or \fnsymbol footnotes, due to the limited number of symbols which are available.

MathJax

Also for MathJax, \footnotename is used for a \footnotemark if the actual footnote number is not known. To redefine it, provide it before loading lwarp:

```
\providecommand{\footnotename}{something}
\usepackage{lwarp}
```

Similar for sidenotes. For endnotes:

```
\def\endnotename{something}% \def allows name to start with
"end"
```

For the pagenote package, there is no \pagenotename to define, since there is no \pagenotemark command.

footmisc

The footmisc stable option is emulated by lwarp.

⚠ sectioning commands

When using footnotes in sectioning commands, to generate consistent results between print and HTML, use the footmisc package with the stable option, provide a short TOC entry, and \protect the \footnote:

```
\usepackage[stable]{footmisc}
. . .
\subsection[Subsection Name]
    {Subsection Name\protect\footnote{A footnote.}}
```

memoir with footmisc
⚠ memoir

If using memoir class, with which lwarp preloads footmisc, the stable option must be declared before lwarp is loaded:

```
\PassOptionsToPackage{stable}{footmisc}
\usepackage{lwarp}
. . .
```

Do not use a starred sectioning command. As an alternative, it may be possible to adjust \secnumdepth instead.

fancybox, fancyvrb
⚠ \VerbatimFootnotes
⚠ sectioning or displaymath

If using fancybox or fancyvrb with \VerbatimFootnotes, and using footnotes in a sectioning command or display math, use \footnotemark and \footnotetext:

```
\subsection[Subsection Name]
    {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when `\VerbatimFootnotes` are selected. The browser usually compensates.

pfnote
⚠ pfnote numbers

While emulating pfnote, lwarp is not able to reset HTML footnote numbers per page number to match the printed version, as HTML has no concept of page numbers. lwarp therefore uses continuous footnote numbering even for pfnote.

bigfoot, manyfoot
⚠ verbatim

Verbatim footnotes are not yet supported.

If using the bigfoot package, and possibly also manyfoot, problems may occur with counter allocation because lwarp uses many counters, and there is a difference in how counters numbered 256 and up are handled in PDF LaTeX. With bigfoot this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining bigfoot or manyfoot footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use XeLaTeX or LuaLaTeX instead of PDF LaTeX.

8.5.5 xr, xr-hyper, and xcite packages

See section 5.17.

8.6 Front and back matter

8.6.1 Custom classes with multiple authors and affiliations

Some classes allow multiple authors and affiliations. Often it is possible to emulate these using a standard class along with authblk:

```
%\documentclass{customclass} % for print document
\documentclass{article} % for html document

\usepackage{lwarp}
\begin{warpHTML}
\usepackage{authblk}
\let\affiliation\affil % maybe required
\end{warpHTML}
```

8.6.2 Starred chapters and sections

HTML page and TOC

The following describes `\ForceHTMLPage` and `\ForceHTMLTOC`, which may be used for endnotes, glossaries, tocbibind, bibliographies, and the index. See the following sections where applicable. Continue here if interested in the reason for adding these commands to lwarp.

Some packages use \chapter* or \section* to introduce reference material such as notes or lists, often to be placed in the back matter of a book. These starred sections are placed inline instead of on their own HTML pages, and they are not given TOC entries.

lwarp provides a method to cause a starred section to be on its own HTML page, subject to FileDepth, and also a method to cause the starred section to have its own TOC entry during HTML output.

\ForceHTMLPage

To place a starred section on its own HTML page, use \ForceHTMLPage just before the \chapter* or \section*. lwarp will create a new page for the starred sectional unit.

A starred sectional unit does not have a TOC entry unless one is placed manually. The typical method using \phantomsection and \addcontentsline works for inline text but fails when the new starred section is given its own webpage after the TOC entry is created, or when creating an EPUB where the TOC entry will point to the page before the starred section. If the starred section has its own HTML page but no correct TOC entry pointing to that page, the page will be inaccessible unless some other link is created.

⚠ inaccessible HTML page

\ForceHTMLTOC

To automatically force the HTML version of the document to have a TOC entry for a starred section, use \ForceHTMLTOC just before the \chapter* or \section*, and place \phantomsection and \addcontentsline inside a warpprint environment.

For print output, \ForceHTMLTOC and \ForceHTMLPage have no effect.

8.6.3 abstract package

Pkg abstract

⚠ missing TOC

If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

8.6.4 titling and authblk

Pkg titling

Pkg authblk

package support

⚠ load order

\published and \subtitle

lwarp supports the native LaTeX titling commands, and also supports the packages authblk and titling. If both are used, authblk should be loaded before titling.

If using the titling package, additional titlepage fields for \published and \subtitle may be added by using \AddSubtitlePublished in the preamble. See section 69.8.

8.6.5 tocloft package

Opt [tocloft] titles

Pkg tocloft

Pkg tocloft

⚠ tocloft & other packages

If using tocloft with tocbibind, anonchap, fncychap, or other packages which change chapter title formatting, load tocloft with its titles option, which tells tocloft to use standard LaTeX commands to create the titles, allowing other packages to work with it.

8.6.6 appendix package

Pkg appendix

⚠ incorrect TOC link

During HTML conversion, the option `toc` without the option `page` results in a TOC link to whichever section was before the `appendices` environment. It is recommended to use both `toc` and also `page` at the same time.

8.6.7 pagenote package

Pkg pagenote

pagenote works as-is, but the `page` option is disabled.

⚠ labels

Note that labels in page notes do not appear as expected, even in the print version.

8.6.8 endnotes package

Pkg endnotes

table of contents

To place the endnotes in the TOC, use:

```
\usepackage{endnotes}
\appto\enoteheading{\addcontentsline{toc}{section}{\notesname}}
\renewcommand*{\notesname}{Endnotes} % optional
```

HTML page

To additionally have the endnotes on their own HTML page, if `FileDepth` allows:

```
\ForceHTMLPage
\theendnotes
```

⚠ `\endnotemark` numbering

If using MathJax, see section 8.5.4 regarding the use of `\endnotemark` and `\endnotetext`.

8.6.9 *BibTeX*

`\etalchar`

Displays a superscript "+" to indicate "and others".

⚠ Modify *.bib

When enough authors are cited for a source, BibTeX may use the `\etalchar` command to display a math superscript with a + character to indicate "and others". Without modification, this will result in an "Improper `\prevdepth`" error. At present, lwarp requires that `\etalchar` be replaced by a text superscript. To do so, add to the start of the `.bib` file the following:

```
@PREAMBLE{"\let\etalchar\relax \newcommand{\etalchar}[1]{\textsuperscript{#1}}"}
```

8.6.10 xcite package

See section 5.17.

8.6.11 gloss package

Pkg gloss

⚠ compiling

To process the HTML glossary:

```
bibtex <projectname>_html.gls
```

8.6.12 glossaries package

Pkg glossaries

processing glossaries

Opt GlossaryCmd

Default: makeglossaries

Opt [lwarpmk] printglossary

Opt [lwarpmk] htmlglossary

lwarpmk has the commands **lwarpmk printglossary** and **lwarpmk htmlglossary**, which process the glossaries created by the glossaries package using that package's *makeglossaries* program.

The shell command to execute is set by the lwarp option GlossaryCmd, which defaults to **makeglossaries**. The print or HTML glossary filename is appended to this command.

⚠ *makeglossaries* not found

In some situations it may be required to modify the default command, such as to add the **perl** command in front:

```
\usepackage[
   GlossaryCmd={perl makeglossaries},
] {lwarp}
```

xindy language

To set the language to use for processing glossaries with *xindy*:

```
\usepackage[
   GlossaryCmd={makeglossaries -L english},
] {lwarp}
```

Other options for *makeglossaries* may be set as well.

placement and TOC options

The glossaries may be placed in a numbered or unnumbered section, given a TOC entry, and placed inline or on their own HTML page:

Numbered section, on its own HTML page:

```
\usepackage[xindy,toc,numberedsection=nolabel]{glossaries}
...
\printglossaries
```

Unnumbered section, inline with the current HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\printglossaries
```

Unnumbered section, on its own HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\ForceHTMLPage
\printglossaries
```

⚠ glossary style

The default style=item option for glossaries conflicts with lwarp, so the style is forced to index instead.

⚠ number list

The page number list in the printed form would become \namerefs in HTML, which could become a very long string if many items are referenced. For now, the number list is simply turned off.

print/HTML versions

The print and HTML versions of the glossary differ in their internal page numbers. Separate commands for generating print and HTML glossaries are used, even though the page number is currently ignored.

8.6.13 nomencl package

Pkg nomencl

To process the HTML nomenclature:

```
makeindex <project>_html.nlo -s nomencl.ist -o
<project>_html.nls
```

8.6.14 Indexing overview

There are many ways to process indexes for a LaTeX document, including native LaTeX capabilities, a number of packages and classes, the possible availability of shell escape and *latexmk*, and the need to process print and HTML versions. lwarp attempts to provide easy recompilation of indexes along with the rest of the document, but the various indexing options must be set correctly. Numerous examples are given below. Some differ in minor details, so the important parts are highlighted in red, and options are in green.

Once set up properly, the entire document may be recompiled with **`lwarpmk print`** and **`lwarpmk html`**. In some cases, it will also be necessary to compile the indexes with **`lwarpmk printindex`** and **`lwarpmk htmlindex`**. A recompile may then be forced with **`lwarpmk print1`** and **`lwarpmk html1`**.

manual processing

The user may continue to process indexes manually or by shell script without the use of *lwarpmk*, but adjustments will be required to process HTML indexes as well. In general, `*.idx` and `*.ind` files will be accompanied by `*_html.idx` and `*_html.ind` files.

custom index style

If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

link appearance

To control how the index links appear in the HTML output, see the `IndexRef` option in section 7.5, page 105.

source code

See section 79 for lwarp's core index and glossary code, section 340 for index, section 571 for splitidx, section 338 for imakeidx, section 625 for tocbibind, and section 692.17 for memoir's indexing patches.

8.6.15 Indexing with makeidx, *makeindex*, *xindy*, *xindex*, gindex

lwarpmk processing

The following allow the user to process indexes automatically, or using *lwarpmk*'s commands:

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

Prog makeindex

For a single index using *makeindex*:

```
\usepackage[makeindex,latexmk] {lwarp}
```

The usual `.idx` and `.ind` files will be used, along with the new `lwarp.ist` style file. When creating the HTML index, "`_html`" is automatically appended to each of the names.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.20.

Prog xindy

For a single index using *xindy*:

```
\usepackage[
    xindy,
    xindyLanguage=english,                    <optional>
    xindyCodepage=utf8,                       <optional>
    latexmk                                   <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used, along with the new `lwarp.xdy` style file.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.21.

Prog xindex

For a single index using *xindex*:

```
\usepackage[
    xindex,
    latexmk                                   <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, see section 8.6.22.

Pkg gindex

For a single index using gindex:

```
\usepackage[
    makeindex,
    makeindexStyle=gindex.ist,
    . . . or . . .
    makeindexStyle=gindexh.ist,
    latexmk                                   <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

To use a custom configuration file, copy `gindex.ist` to a new file, modify, then specify it with `MakeindexStyle` as above. lwarp will automatically adapt to gindex's `\indexpagessep` and `\indexrangesep` settings.

8.6.16 Indexing with index

Prog index

lwarp is told how to use *makeindex* using the PrintIndexCmd and HTMLIndexCmd options. The file lwarp.ist is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

For multiple indexes using *makeindex* and index:

(Assuming that the second index has file extensions .sist and .sind)

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist
      -o <projectname>.sind <projectname>.sidx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist
      -o <projectname>_html.sind <projectname>_html.sidx
  }
]{lwarp}
\usepackage{index}
. . .
\makeindex
\newindex{secondname}{sidx}{sind}{Second Index}
```

⚠ WINDOWS *For Windows, replace the two ";" characters with "&".*

When creating the HTML index, "_html" is automatically appended to the index filenames.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

If the latexmk option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

8.6.17 Indexing with splitidx

Prog splitidx

lwarp is told how to use *splitindex* using the PrintIndexCmd and HTMLIndexCmd options. The file lwarp.ist is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

If the latexmk option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

⚠ \thepage When using \AtWriteToIndex or \AtNextWriteToIndex, the user must not refer

to \thepage during HTML output, as the concept of a page number is meaningless. Instead, do

```
\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the \index-like action occurs, and then refer to \arabic{LWR@autoindex} instead of \thepage where the reference should occur.

See section 692.17 in the lwarp-patch-memoir package for the \@@wrspindexhyp macro as an example.

For multiple indexes using *makeindex* and splitidx:

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    splitindex <projectname> -- -s lwarp.ist
  },
  HTMLIndexCmd={
    splitindex <projectname>_html -- -s lwarp.ist
  }
]{lwarp}
\usepackage{splitidx}
. . .
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, "_html" is automatically appended to each of the names.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

For multiple indexes using *xindy* and splitidx:

```
\usepackage[
  xindy, latexmk,
  PrintIndexCmd={
    splitindex -m xindy <projectname> -- -M lwarp.xdy
      -L english -C utf8                    <optional>
  },
  HTMLIndexCmd={
    splitindex  -m  xindy  <projectname>_html  --  -M
lwarp.xdy
      -L english -C utf8                    <optional>
  }
]{lwarp}
\usepackage{splitidx}
. . .
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, "_html" is automatically appended to each of the names.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

8.6.18 Indexing with imakeidx

Prog imakeidx

Due to the number of methods which may be used to process multiple indexes, the options for style file and *xindy* language and codepage must be specified in one of several different ways. These are described in detail later in this section, but are summarized here.

If shell escape is used, imakeidx will automatically compile the indexes by itself. Options specifying a custom style file and *xindy* language and codepage must be specified for each `\makeindex` command using its `options=` option, which must include lwarp's special `lwarp.ist` or `lwarp.xdy` file, or a file based on them. If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

The `splitindex` option is also available of shell escape is used, in which case the splitidx package and *splitindex* program will also be used.

If shell escape is not possible, *latexmk* may be used to automatically compile the indexes. The style, language, and codepage options are specified with lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options. These are passed to *latexmk* by *lwarpmk*'s **lwarpmk printindex** and **lwarpmk htmlindex** commands.

Where shell escape and *latexmk* are not possible, *lwarpmk* may be used to manually compile the indexes. lwarp's `PrintIndexCmd` and `HTMLIndexCmd` options are used.

For a single or multiple indexes using *makeindex* and imakeidx:

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```
\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]
```

imakeidx will automatically compile the indexes. Shell escape is not required while using *makeindex*. `latexmk` may be specified, and if so it will be used for **lwarpmk print** and **lwarpmk html**, but *imakeidx* will actually create the indexes.

For a single or multiple indexes using *makeindex* and *splitindex* with imakeidx:

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```
\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]
```

⚠ enable shell escape

Shell escape is required while using *splitindex*. For the first compile, use

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember that shell escape was used.

imakeidx will automatically execute *splitindex*, and will also use *makeindex* to compile the indexes.

`latexmk` may be specified, and if so it will be used for **`lwarpmk print`** and **`lwarpmk html`**, but *imakeidx* will actually create the indexes.

For multiple indexes using *xindy* and imakeidx, using shell escape:

Options may be given to imakeidx's `\makeindex` command. The style file `lwarp.xdy` is automatically used for HTML output, and is not necessary for print output since the output will be similar. If language or codepage must be set, they should be specified as options for `\makeindex`, since imakeidx will process the indexes.

```
\usepackage[xindy,latexmk] {lwarp}
\usepackage[xindy,splitindex]{imakeidx}
. . .
\makeindex[
  options={ -M lwarp.xdy -L english -c utf8 }
]
\makeindex[
  name=secondname,
  options={ -M lwarp.xdy -L english -c utf8 }
]
```

⚠ enable shell escape

For the first compile, use

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember that shell escape was used.

imakeidx will automatically execute *splitindex* if selected, and will also use *xindy* to compile the indexes.

If selected, *latexmk* will automatically recompile the entire document as necessary.

For indexes using *xindy* and *imakeidx*, without shell escape, but *with latexmk*:

lwarp's options are used, and are passed to *latexmk*.

```
\usepackage[
  xindy,
  xindyLanguage=english,                    <optional>
  xindyCodepage=utf8,                       <optional>
  latexmk,
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]
```

latexmk will create the indexes automatically when **`lwarpmk print`** and **`lwarpmk html`** are executed.

For indexes using *xindy* and *imakeidx*, without shell escape, and *without latexmk*:

lwarpmk must be told how to create the indexes:

```
\usepackage[
  xindy,
  PrintIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname.idx
  },
  HTMLIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>_html.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname_html.idx
  }
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]
```

⚠ WINDOWS *For Windows, replace the two ";" characters with "&".*

`<projectname>` is the `\jobname`: if compiling "`name.tex`", use the filenames `name.idx` and `name_html.idx`.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

For multiple indexes using *xindex* and imakeidx, using shell escape:

xindex, *makeindex*, *imakeidx*, and *splitindex* can all work together:

```
\usepackage[%
  xindex,
  xindexConfig=-imakeidx,
  latexmk
] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[%
  options={ -s lwarp.ist} }
]
\makeindex[
  name=secondname,
  options={ -s lwarp.ist} }
]
```

⚠ enable shell escape

For the first compile, use:

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember if shell escape was used.

xindex will use *imakeidx*, and *imakeidx* will automatically execute *splitindex* if selected.

If selected, *latexmk* will automatically recompile the entire document as necessary.

8.6.19 Indexes with memoir

For a single index with memoir and *makeindex*:

```
\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex
```

The usual `.idx` and `.ind` files will be used, along with the `lwarp.ist` style file.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

For multiple indexes with memoir and *makeindex*, using *latexmk*:

lwarp's options are used, and are passed to *latexmk*.

```
\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex
\makeindex[secondname]
```

lwarpmk will use *latexmk* to create the indexes automatically when the user executes **lwarpmk print** and **lwarpmk html**.

For multiple indexes with memoir and *makeindex*, *without* latexmk:

lwarpmk must be told how to create the indexes:

```
\documentclass{memoir}
\usepackage[
  makeindex,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist secondname.idx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist secondname_html.idx
  }
]{lwarp}
. . .
\makeindex
\makeindex[secondname]
```

⚠ WINDOWS *For Windows, replace the two ";" characters with "&".*

`<projectname>` is the `\jobname`: if compiling "`name.tex`", use the filenames `name.idx` and `name_html.idx`.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

For a single index with memoir and *xindy*:

```
\documentclass{memoir}
\usepackage[
    xindy,
    xindyLanguage=english,                  <optional>
    xindyCodepage=utf8,                     <optional>
    latexmk                                 <optional>
]{lwarp}
. . .
\xindyindex
\makeindex
```

The usual `.idx` and `.ind` files will be used, along with the `lwarp.xdy` style file.

lwarpmk will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

For multiple indexes with memoir and *xindy*, using latexmk:

lwarp's options are used, and are passed to *latexmk*.

```
\documentclass{memoir}
\usepackage[
    xindy,
    xindyLanguage=english,                    <optional>
    xindyCodepage=utf8,                       <optional>
    latexmk
]{lwarp}
. . .
\xindyindex
\makeindex
\makeindex[secondname]
```

lwarpmk will use *latexmk* to create the indexes automatically.

For multiple indexes with memoir and *xindy*, *without* latexmk:

lwarpmk must be told how to create the indexes:

```
\documentclass{memoir}
\usepackage[

      secondname_html.idx
  }
]{lwarp}
. . .
\xindyindex
\makeindex
\makeindex[secondname]
```

⚠ WINDOWS *For Windows, replace the four ";" characters with "&".*

`<projectname>` is the `\jobname`: if compiling "`name.tex`", use the filenames `name.idx` and `name_html.idx`.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

8.6.20 Using a custom *makeindex* style file

Prog `makeindex`
File `lwarp.ist`

When using *makeindex*, *lwarpmk* uses the file `lwarp.ist` to process the index. This file is over-written by lwarp whenever a print version of the document is processed.

To use a custom *makeindex* style file:

1. Copy `lwarp.ist` to a new filename such as `projectname.ist`
2. Make changes to `projectname.ist`. Keep the lines which refer to `\hyperindexref`. These lines creates the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.
3. If changing

   ```
   delim_n -and- delim_r
   ```

   in `projectname.ist`, then in the document preamble redefine

   ```
   \IndexPageSeparator -and- \IndexRangeSeparator
   ```

   to match.

Opt `makeindexStyle`

4. In the document source use the `makeindexStyle` option for lwarp:

   ```
   \usepackage[
     . . . other options . . .
     makeindex,
     makeindexStyle=projectname.ist,
   ]{lwarp}
   ```

   Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.
5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `projectname.ist` file instead of `lwarp.ist`.

8.6.21 Using a custom *xindy* style file

Prog `xindy`
File `lwarp.xdy`

When using *xindy*, *lwarpmk* uses the file `lwarp.xdy` to process the index. This file is over-written by lwarp whenever a print version of the document is processed.

To use a custom *xindy* style file:

1. Copy `lwarp.xdy` to a new filename such as `projectname.xdy`
2. Make changes to `projectname.xdy`.

   Keep the lines which refer to `\hyperindexref`:

   ```
   (define-attributes (("hyperindexref")))
   (markup-locref :open "\hyperindexref{" :close "}")
   ...
   (markup-locref :open "\textit{\hyperindexref{" :close "}}" :attr "textit")
   ```

   These lines create the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.

   To create custom styles, refer to the lines for `\textbf` and `\textit`.
3. If changing any of

   ```
   markup-locref-list :sep
   markup-locclass-list :open
   markup-locclass-list :sep
   markup-crossref-layer-list :sep
   markup-range :sep
   ```

in `projectname.xdy`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

Opt `xindyStyle`

4. In the document source use the `xindyStyle` option for lwarp:
```
\usepackage[
  . . . other options . . .
  xindy,
  xindyStyle=projectname.xdy,
]{lwarp}
```
Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `projectname.xdy` file instead of `lwarp.xdy`.

8.6.22 Using a custom *xindex* style file

Prog `xindex`

To use a custom *xindex* style file:

⚠ filename

1. Copy `xindex-cfg.lua` to a new filename such as `xindex-projectname.lua`. The filename must start with `xindex-` and end with `.lua`.
2. Make changes to `xindex-projectname.lua`.
3. If changing
```
itemPageDelimiter -and- rangeSymbol
```
in `xindex-projectname.lua`, then in the document preamble redefine
```
\IndexPageSeparator -and- \IndexRangeSeparator
```
to match.

Opt `xindexConfig`

4. In the document source use the `xindexConfig` option for lwarp:
```
\usepackage[
  . . . other options . . .
  xindex,
  xindexConfig=projectname,   % (without xindex- or .lua)
]{lwarp}
```
Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `xindex-projectname.lua` file instead of the default `xindex-cfg.lua`.

8.6.23 Additional indexing limitations

⚠ *xindy* with hyperref

xindy and hyperref may not work well together for print output with "see", "see also", reference ranges, or stylized index references. It may be necessary to turn off hyper-referencing for indexes:

```
\usepackage[hyperindex=false]{hyperref}
```

⚠ empty index

If an HTML index is empty, it may be necessary to add the following before lwarp is loaded:

```
\usepackage{morewrites}
\morewritessetup{allocate=10}
. . .
\usepackage{lwarp}
```

makeindex custom display styles

When using *makeindex*, custom display styles are possible:

```
\begin{warpprint}
\newcommand{\notesstyle}[1]{#1nn}
\end{warpprint}

\begin{warpHTML}
\makeatletter
\newcommand{\notesstyle}[1]{\LWR@doindexentry{#1} notes }
\makeatother
\end{warpHTML}
. . .
A sentence.\index{key|notesstyle}
```

xindy custom display styles

For custom styles with *xindy*, see `lwarp.xdy` for `\textbf` and `\textit` as examples.

8.6.24 Index positions, TOC, tocbibind

placement and TOC options

An index may be placed inline with other HTML text, or on its own HTML page:

Pkg makeidx

Inline, with a manual TOC entry:

A commonly-used method to introduce an index in a LaTeX document:

```
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\printindex
```

Pkg makeidx

On its own HTML page, with a manual TOC entry:

```
\begin{warpprint}
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\end{warpprint}
\ForceHTMLPage
\ForceHTMLTOC
\printindex
```

Pkg tocbibind

Inline, with an automatic TOC entry:

The tocbibind package may be used to automatically place an entry in the TOC.

```
\usepackage[nottoc]{tocbibind}
. . .
\cleardoublepage
\phantomsection % to fix print-version index link
\printindex
```

Pkg tocbibind

On its own HTML page, with an automatic TOC entry:

```
\usepackage[nottoc]{tocbibind}
. . .
\cleardoublepage
\phantomsection % to fix print-version index link
\ForceHTMLPage
\printindex
```

Opt [tocbibind] numindex

numbered index section

Use the tocbibind `numindex` option to generate a numbered index. Without this option, the index heading has no number.

Other packages, such as imakeidx, may also have options for including the index in the Table of Contents.

Pkg tocloft

⚠ tocloft & other packages

If using tocloft with tocbibind, anonchap, fncychap, or other packages which change chapter title formatting, load tocloft with its `titles` option, which tells tocloft to use standard LaTeX commands to create the titles, allowing other packages to work with it.

8.7 Math

8.7.1 Math in section names

⚠ math in section names

If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

8.7.2 Rendering tradeoffs

Math rendering

Math may be rendered as SVG graphics or using the MathJax JavaScript display engine.

SVG files

Rendering math as images creates a new SVG file for each expression, except that an MD5 hash is used to combine identical duplicates of the same inline math expression into a single file, which must be converted to SVG only once. Display math is still handled as individual files, since it may contain labels or references which are likely to change.

SVG inline

The SVG images are currently stored separately, but they could be encoded inline directly into the HTML document. This may reduce the number of files and potentially speed loading the images, but slows the display of the rest of the document before the images are loaded.

PNG files

Others LaTeX-to-HTML converters have used PNG files, sometimes pre-scaled for

print resolution but displayed on-screen at a scaled down size. This allows high-quality print output at the expense of larger files, but SVG files are the preferred approach for scalable graphics.

MathML

Conversion to MathML might be a better approach, among other things allowing a more compact representation of math than SVG drawings. Problems with MathML include limited browser support and some issues with the fine control of the appearance of the result. Also see section 10 regarding EPUB output with MathJax.

8.7.3 SVG option

SVG math option

For SVG math, math is rendered as usual by LaTeX into the initial PDF file using the current font[14], then is captured from the PDF and converted to SVG graphics via a number of utility programs. The SVG format is a scalable-vector web format, so math may be typeset by LaTeX with its fine control and precision, then displayed or printed at any size, depending on (sometimes broken) browser support. An HTML `alt` attribute carries the LaTeX code which generated the math, allowing copy/paste of the LaTeX math expression into other documents.

SVG image font size

For the `lateximage` environment, the size of the math and text used in the SVG image may be adjusted by setting `\LateximageFontSizeName` to a font size name — *without the backslash*, which defaults to:

```
\renewcommand{\LateximageFontSizeName}{normalsize}
```

For inline SVG math, font size is instead controlled by `\LateximageFontScale`, which defaults to:

```
\newcommand*{\LateximageFontScale}{.75}
```

SVG math copy/paste

For SVG math, text copy/paste from the HTML `<alt>` tags lists the equation number or tag for single equations, along with the LaTeX code for the math expression. For $\mathcal{AMS}$ environments with multiple numbers in the same environment, only the first and last is copy/pasted, as a range. No tags are listed inside a starred $\mathcal{AMS}$ environment, although the `\tag` macro will still appear inside the LaTeX math expression.

⚠ SVG math size, baseline

SVG math sizing and baselines are improved if the graphics or graphicx package is loaded. An almost-invisible marker is placed at either end of the image to assist in cropping and computing the baseline. A warning is issued at the end of the compile if graphics or graphicx are not used.

⚠ SVG math in TeX boxes

SVG math does not work inside TeX boxes, since a `\newpage` is required before and after each image.

8.7.4 MathJax option

MathJax math option

Prog MathJax

The MathJax (`mathjax.org`) LaTeX-math to HTML converter may be used to display math.

When MathJax is enabled, math is rendered twice:

[14] See section 677 regarding fonts and fractions.

1. As regular LaTeX PDF output placed inside an HTML comment, allowing equation numbering and cross referencing to be almost entirely under the control of LaTeX, and

2. As detokenized printed LaTeX commands placed directly into the HTML output for interpretation by the MathJax display scripts. An additional script is used to pre-set the equation number format and value according to the current LaTeX values, and the MathJax equation numbering system is ignored in favor of the LaTeX internal system, seamlessly integrating with the rest of the HTML output, including any math appearing in non-MathJax SVG output.

8.7.5 MathJax rendering options

⚠ fonts

MathJax v3 may render using CHTML or SVG. SVG display renders italic characters correctly. To select SVG rendering, right-click on some math, and select

Math Settings → Math Renderer → SVG

Wait a moment for the math to rerender.

8.7.6 Customizing MathJax

equation numbering

lwarp detects and adjusts MathJax equation numbering format for article and book style equations as well as amsmath `\numberwithin` for chapters, sections, and subsections. Custom equation number formats may be set as follows, for example:

```
\renewcommand*{\theequation}{\Alph{section}.\arabic{equation}}
\AtBeginDocument{
  \renewcommand*{\theMathJaxsection}{\Alph{section}.}
}
```

⚠ `subequation`

The amsmath `subequations` environment is supported, but only with `\alpha` subequation numbering.

global customizations

MathJax does not have preexisting support every possible math function. Additional MathJax function definitions may be defined in the preamble. These will be declared at the start of each HTML page, and thus will have a global effect across all HTML pages.

Examples:

```
\begin{warpMathJax}
\CustomizeMathJax{
    \newcommand{\expval}[1]{\langle#1\rangle}
    \newcommand{\abs}[1]{\lvert#1\rvert}
}
\CustomizeMathJax{\newcommand{\arcsinh}{\text{arcsinh}}}
\CustomizeMathJax{\newcommand{\arccosh}{\text{arccosh}}}
\CustomizeMathJax{\newcommand{\NN}{\mathbb{N}}}
\end{warpMathJax}
```

⚠ slow compilation

To avoid a slowdown in compile speed, use the `warpMathJax` environment to prevent its contents from being processed in print or SVG math output. Also, place

each new definition inside its own \CustomizeMathJax. A warning to this effect is issued if an overly-long definition is attempted.

lwarp already provides MathJax customizations for some packages.

siunitx When using siunitx, a similar process may be used to add custom units:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\myunit}{\mathrm{WXYZ}}}
\CustomizeMathJax{\newcommand{\umyunit}{\mathrm{\micro\myunit}}}
\end{warpMathJax}
```

advanced control For more advanced control over dynamically creating custom definitions, see as an example the lwarp definition for \DeclarePairedDelimiterX, in section 399, mathtools.

local customizations For customizations local to the current HTML page only, macros may be defined as follows:

```
\begin{warpMathJax}
\( \newcommand{\macroname}{. . . } \)
\( \newcommand{\anothername}{. . . } \)
\end{warpMathJax}
```

To maintain compile speed, use the warpMathJax environment, and use a separate math environment for each definition.

\ifstar For MathJax, use \ifstar instead of \@ifstar:

```
\CustomizeMathJax{
  \def\myname{
    \ifstar\starredaction\unstarredaction
    % (Do not place anything after!)
  } }
```

\ifnextchar For MathJax, use \ifnextchar instead of \@ifnextchar:

```
\CustomizeMathJax{\def\myname{\ifnextchar X \found\notfound}}
```

"X" may be a single ASCII character, or a hex number inside braces, ex:

```
\CustomizeMathJax{\def\myname{\ifnextchar{0x7B}\found\notfound}}
```

Use "(" or "{0x28}" for a left parenthesis, "{0x7B}" for a left brace, "{0x7D}" for a right brace, or "{0x5C}" for a backslash.

8.7.7 MathJax limitations

MathJax limitations Limitations when using MathJax include:

Prog MathJax

⚠ \multicolumn, multirow

- MathJax does not support \multicolumn or multirow. These may be used in text tabulars or SVG math, but in MathJax math arrays they are emulated. \multicolumn only fills a single cell, resulting in a short row. \multirow simply prints its text on the first line.

⚠ footnotes

- Footnotes are emulated when used inside a MathJax expression. For an equation with a single footnote, the correct footnote number is used. For non-equations, \footnotename is used instead, since the actual number

cannot be tracked. See section 8.5.4 regarding the use of footnotes with MathJax.

⚠ references

- Inside a MathJax expression, references to equations work within the same HTML web page, but do not work when referring to an equation in a different HTML web page. Outside of a MathJax expression, in the text body, references work as expected.

lateximage

- Math appearing inside a lateximage, and therefore also inside a Ti*k*z or `picture` environment, is rendered as SVG math even if MathJaxis used in the rest of the document.

siunitx

- For siunitx, see siunitx package, section 8.7.14.

physics

- For physics, see physics package, section 8.7.16.

tabbing

- A `tabbing` environment is emulated using an HTML `<pre>`. While MathJax is enabled inside `tabbing`, the browser may not correctly render the horizontal alignment of the math and text following after on the same line.

`\text`

- MathJax includes the *textmacros* extension, which supports various macros which are commonly used inside `\text`, such as `\textbf` and text accents. Lwarp supports this extension.

⚠ Unicode

- If using DVI LaTeX or PDF LaTeX, unicode input may not appear correctly in MathJax. Either use XeLaTeX or LuaLaTeX, or replace Unicode special characters such as

  ```
  \text{special character æ}
  ```

  with their special macros, such as

  ```
  \text{special character \ae}
  ```

⚠ other macros and packages

- Many other math-related macros and packages are not directly supported by MathJax, including `\ensuremath` and occasionally-used macros such as `\relax`. While using MathJax, lwarp provides emulation for many of these macros, as well as for footnotes and emulation for dozens of packages (see table 2). In many cases these emulations simply ignore the package in a source-compatible way. Others produce a result which represents the meaning, even if they don't look exact. Look up each package in this document for a description of the limitations of each.

8.7.8 Catcode changes

preamble macros with math

The math shift character `$` is not set for HTML output until after the preamble. Macros defined in the preamble which contain `$` must be enclosed between `\StartDefiningMath` and `\StopDefiningMath` to temporarily change to the HTML meaning of `$`:

```
\StartDefiningMath
\newcommand{. . . }
\StopDefiningMath
```

As an alternative, use `\(` and `\)` instead of `$`, in which case `\StartDefiningMath` and `\StopDefiningMath` are not necessary.

If a package defines macros using `$`, it may be nessary to use `\StartDefiningMath` and `\StopDefiningMath` before and after loading the package.

8.7.9 Complicated inline math objects

`\inlinemathnormal`
`\inlinemathother`

changing contents
complicated `alt` tag

MathJax limitations

An inline math expression is usually converted to a reusable hashed SVG math image, or a MathJax expression. The hash or expression depends on the contents of the math expression. In most cases this math expression is static, such as `$x+1$`, so the image can be reused for multiples instances of the same expression. In some cases, the math expression includes a counter or other object which may change between uses. Another problem is complicated contents which do not expand well in an `alt` tag. Yet another problem is math packages which are only partially emulated in MathJax. The macro `\inlinemathother` may be used before a sequence of dynamic or complicated math expressions, and `\inlinemathnormal` after. Doing so tells lwarp to use unhashed SVG math images for those particular expressins, even if MathJaxis otherwise in use. See section 44.

8.7.10 Complicated display math objects

`\displaymathnormal`

By default, or when selecting `\displaymathnormal`, MathJax math display environments print their contents as text into HTML for MathJax to interpret, and SVG display math environments render their contents as SVG images and use their contents as the `alt` tag of HTML output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated Ti*k*z pictures, compilation will fail.

`\displaymathother`

MathJax unsupported
complicated `alt` tag

When selecting `\displaymathother`, it is assumed that the contents are more complicated than "pure" math. An example is an elaborate Ti*k*z picture, which will not render in MathJax and will not make sense as an HTML `alt` tag. In this mode, MathJax is turned off, math display environments become SVG images, even if MathJax is selected, and the HTML `alt` tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as Ti*k*z pictures are more likely to compile successfully.

8.7.11 Theorems

⚠ cref reference format undefined

If the print version does not use cleveref, place all `\theoremstyle` and `\newtheorem` declarations in the preamble inside `\AtEndPreamble`.[15] For some theorems, it may also be required to add inside `\AtEndPreamble` something such as:

```
\usepackage{etoolbox} % for \ifdef, \AtEndPreamble
\AtEndPreamble{ % if not using cleveref package
  \theoremstyle{definition}
  \newtheorem{dtheorem}{Definition}
  . . .
  \ifdef{\cref}{
    \crefname{Proof}{Proof}{Proofs}
  }{}
}
```

[15] lwarp uses cleveref for the HTML conversion, and loads cleveref `\AtEndPreamble`, just before `\AtBeginDocument`. This is also before the `.aux` file is read.

8.7.12 ntheorem package

Pkg ntheorem

⚠ Font control

This conversion is not total. Font control is via CSS, and the custom LaTeX font settings are ignored.

⚠ Equation numbering

ntheorem has a bug with equation numbering in $\mathcal{AMS}$ environments when the option `thref` is used. lwarp does not share this bug, so equations with `\split`, etc, are numbered correctly with lwarp's HTML output, but not with the print output. It is recommended to use cleveref instead of ntheorem's `thref` option.

8.7.13 mathtools package

Pkg mathtools

`showonlyrefs` is disabled, as it conflicts with cleveref, which is used by lwarp. Equation numbers may not match the print version.

⚠ equation numbering

⚠ italic correction

`mathic` is not emulated for HTML.

⚠ MathJax

If using MathJax:

- mathtools `disallowspaces` does not work for MathJax. Protect brackets which are not optional arguments, such as:

```
\begin{gathered}{}
[p]=1 . . .
\end{gathered}
```

- `showonlyrefs` does not work in MathJax, and will result in a difference in equation numbering compared to the print version.
- `alignat` in MathJax requires math mode, but in LaTeX it doesn't. It may be required to use `warpHTML` and `warpprint` to isolate a version for each mode.
- `\DeclarePairedDelimiter` and related must be in the preamble before `\begin{document}`.

8.7.14 siunitx package

Pkg siunitx

siunitx is well supported by lwarp.

Limitations Some general limitations:

fractions

Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

`\cancel` is not currently supported for siunitx v3.

Negative values are not automatically colored.

⚠ tabular

Tabular `S` and `s` columns are rendered as simple `c` columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for

⚠ drop-exponent

`drop-exponent`, without which the value will be shown incorrectly.

⚠ table-auto-round

`table-auto-round` is ignored.

Math rendering Math may be rendered in several ways in the same document:

For math mode with SVG display: The original siunitx code is used while generating the SVG image.

For HTML text mode: lwarp uses siunitx code patched for HTML, and simplified units.

For math expressions while using MathJax: A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

Custom units siunitx allows customized units:

`\DeclareSIUnit` `{`⟨*name*⟩`}` `{`⟨*definition*⟩`}`

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in SVG math or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

`\HTMLDeclareSIUnit` `{`⟨*name*⟩`}` `{`⟨*definition*⟩`}`

⚠ v3 only! Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit` declares a simplified version of the unit for HTML, for example if the print-mode unit uses TEX boxes or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MathJax:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

Predefined units Most units work as-is with HTML. For the following units, lwarp has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

⚠ MathJax

Document modifications required for MathJax

⚠ `\sisetup`
- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MathJax. The MathJax emulation also ignores most macro options.

⚠ complex numbers
- Complex numbers are displayed as entered, ignoring `output-complex-root`.

custom units
- Custom units may be added with `\CustomizeMathJax`. For example, from lwarp-common-mathjax-siunitx:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_{\mathrm{h}}}}
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

⚠ unit spacing
- Units work better using ~ between units instead of using periods.

Table 9: \includegraphics and file names

Print image file	HTML image file	Command to use
image.pdf[a]	image.svg[a]	\includegraphics{image}
image.eps[a]	image.svg[a]	\includegraphics{image}
image.jpg	—[b]	\includegraphics{image}
image.png	—[b]	\includegraphics{image}
image.JPG	—[b]	\includegraphics{image.JPG}[c]
image.PNG	—[b]	\includegraphics{image.PNG}[c]
image.jpg	image.gif	\includegraphics{image}

[a]: Must be a lowercase file extension.
[b]: The same file is used for print and HTML.
[c]: The uppercase extension must be specified.

⚠ \square, \cubic

- To square or cube compound units, enclose the following compound units in braces:

  ```
  \cubic{\centi\meter}
  ```

  Single units do not require braces.
- For \numlist, the argument is printed as text as-is, so use space between semicolons for improved readability.

⚠ Missing $ inserted

- If using parse-numbers = false, also use \num or \qty. siunitx=siunitx>Missing $ inserted.

Also see MathJax option, section 8.7.4.

8.7.15 units and nicefrac packages

Pkg units
Pkg nicefrac

units and nicefrac work with lwarp, but MathJax does not have an extension for units or nicefrac. These packages do work with lwarp's option svgmath.

8.7.16 physics package

Pkg physics

physics works as-is for HTML with SVG math.

For MathJax, the MathJax v3 physics extension is used.

8.8 Graphics

Pkg graphics
Pkg graphicx

file extensions

Per table 9, image filenames may be specified either with or without an extension. If an extension is given it will be used as-is, for either print or HTML output. If no extension is given, a list of possible extensions is tried, which depends on whether print or HTML is being generated. This allows a PDF file for print and a

⚠ case sensitive

SVG file for HTML, for example. If no extension is given, the automatic search will only return lowercase extensions, even if the filename actually has an uppercase extension, and lwarp cannot get around this problem, so image file extensions must be lowercase to be seen by the HTML browser with lwarp. For example, name the image file `image.pdf` instead of `image.PDF`, but refer to it in the source as `image`, without an extension. For images which may be used as-is with either print or HTML, such as JPG or PNG, you may use a capitalized extension if it is specified in the source, such as `image.JPG`.

`\includegraphics` file formats

For `\includegraphics` with `.pdf` or `.eps` files, the user must provide a `.pdf` or `.eps` image file for use in print mode, and also a `.svg`, `.png`, or `.jpg` version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, lwarp will automatically choose the `.pdf` or `.eps` format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a `.pdf` or `.eps` image is referred to with its file extension, the extension will be changed to `.svg` for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html

Prog `pdftocairo`

PDF to SVG

To convert a PDF image to SVG, use the utility *pdftocairo*:

Enter ⇒ **`pdftocairo -svg filename.pdf`**

Prog `lwarpmk pdftosvg`

For a large number of images, use *lwarpmk*:

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

Prog `lwarpmk epstopdf`

Prog `epstopdf`

epstopdf package

For EPS images converted to PDF using the package epstopdf, use

Enter ⇒ **`lwarpmk pdftosvg *.PDF`**

to convert to SVG images.

DVI LaTeX

When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of filenames)**

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

PNG and JPG

For PNG or JPGwhile using *pdflatex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

GIF

GIF files may be used for HTML, but another format must also be provided for print output.

file extension priorities

If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

duplicate files

⚠ image not displayed

A complication occurs if a file of the same name exists elsewhere in the TeX tree, such as a test image from some LaTeX package. TeX looks in the local document directory before considering the directories specified by `\graphicspath`, but the TeX tree is found as “local”, so any file in the tree is found before the directories

in \graphicspath. To use such an image, it must be copied to the document's directory to be used for HTML, and furthermore must be in the document's base directory instead of an images subdirectory.

⚠ graphics vs. graphicx

If using the older graphics syntax, use both optional arguments for \includegraphics. A single optional parameter is interpreted as the newer graphicx syntax. Note that viewports are not supported by lwarp — the entire image will be shown.

⚠ viewport

units

For \includegraphics, avoid px and % units for width and height, or enclose them inside warpHTML environments. For font-proportional image sizes, use ex or em. For fixed-sized images, use cm, mm, in, pt, or pc. Use the keys width=.5\linewidth, or similar for \textwidth or \textheight to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the scale option, since it is not well supported by HTML browsers.

options

\includegraphics accepts width and height, origin, rotate and scale, plus new class and alt keys. (alt has recently been incorportated into graphicx itself.)

HTML class

With HTML output, \includegraphics accepts an optional class=xyz keyval combination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

HTML alt tags

Likewise, the \includegraphics alt key adds an HTML alt tag to an image, and is ignored for print output. If not assigned, each image is given an alt tag according to \ImageAltText.

⚠ scale

Avoid using the \includegraphics scale option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

\rotatebox

\rotatebox accepts the optional origin key.

⚠ browser support

\rotatebox, \scalebox, and \reflectbox depend on modern browser support. The css3 standard declares that when an object is transformed the whitespace which they occupied is preserved, unlike LaTeX, so expect some ugly results for scaling and rotating.

8.8.1 tikz package

Pkg tikz

⚠ displaymath and matrices

If using display math with tikzpicture or \tikz, along with matrices with the & character, the document must be modified as follows:

```
\usepackage{tikz}
\tikzset{every picture/.style={ampersand replacement=\&}}
```

and each instance of & in the tikz expression must be replaced with \&.

8.8.2 grffile package

Pkg grffile

grffile is supported as-is. File types known to the browser are displayed, and

⚠ matching PDF and SVG

unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

8.8.3 color package

Pkg color

color is superceded by xcolor, and lwarp requires several of the features of xcolor. When color is requested, xcolor is loaded as well.

8.8.4 xcolor package

Pkg xcolor

\colorboxBlock and \fcolorboxBlock

\colorboxBlock and \fcolorboxBlock are provided for increased HTML compatibility, and they are identical to \colorbox and \fcolorbox in print mode. In HTML mode they place their contents into a instead of a . These s are set to display: inline-block so adjacent \colorboxBlocks appear side-by-side in HTML, although text is placed before or after each.

Print-mode definitions for \colorboxBlock and \fcolorboxBlock are created by lwarp's core if xcolor is loaded.

background: none

\fcolorbox and \fcolorboxBlock allow a background color of none, in which case only the frame is drawn, which can be useful for HTML.

color support

Color definitions, models, and mixing are fully supported without any changes required.

colored tables

\rowcolors is supported, except that the optional argument is ignored so far.

colored text and boxes

\textcolor, \colorbox, and \fcolorbox are supported.

\color and \pagecolor

\color and \pagecolor are ignored. Use CSS or \textcolor where possible.

8.8.5 epstopdf package

Pkg epstopdf

⚠ convert to .svg

Images with an .eps extension will be converted to .pdf. The HTML output uses the .svg version, so use

Enter ⇒ **lwarpmk pdftosvg <listofPDFfiles>**

to generate .svg versions.

8.8.6 pstricks package

Pkg pstricks

⚠ use pspicture

All pstricks content should be contained inside a pspicture environment.

8.8.7 pdftricks package

Pkg pdftricks

⚠ convert image files

The pdftricks image files <jobname>-fig*.pdf must be converted to .svg, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

Enter ⇒ **lwarpmk pdftosvg <jobname>-fig*.pdf**

8.8.8 psfrag package

Pkg psfrag

⚠ use psfrags

The psfrags environment is modified to use lateximage to encapsulate the image. Always use a psfrags environment to contain any local \psfrag macros and the associated \includegraphics or \epsfig calls. Outside of a psfrags environment, psfrags adjustments will not be seen by lwarp.

⚠ Tip: Use a mono-spaced font for the tags in the EPS file.

8.8.9 pstool package

Pkg pstool

\graphicspath is ignored, and the file directory must be stated.

⚠ path and filename

The filename must not have a file extension.

Use

Enter ⇒ **lwarpmk html**

followed by

Enter ⇒ **lwarpmk limages**

.

8.8.10 asymptote package

Pkg asymptote

To compile:

```
pdflatex project.tex
asy project-*.asy
pdflatex project.tex

lwarpmk print
asy project-*.asy
lwarpmk print1
lwarpmk print1

lwarpmk html
asy project_html-*.asy
lwarpmk html1
lwarpmk html1
lwarpmk limages
```

8.8.11 overpic package

Pkg overpic

⚠ scaling

The macros \overpicfontsize and \overpicfontskip are used during HTML generation. These are sent to \fontsize to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the overpic and Overpic environments.

8.8.12 Multimedia packages

Pkg multimedia
Pkg movie15
Pkg media9

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

8.9 Tabbing

The tabbing environment works, except that SVG math and lateximages do not yet work inside the environment.

⚠ math in tabbing

If math is used inside tabbing, place tabbing inside a lateximage environment, which will render the entire environment as a single SVG image.

8.10 Tabular

8.10.1 `tabular` environment

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, multirows, siunitx `S` columns, or the packages multirow, longtable, supertabular, or xtab.

Defining macros and environments:

⚠ Misplaced alignment tab character &

- When defining environments or macros which include `tabular` and instances of the `&` character, it may be necessary to make `&` active before the environment or macro is defined, then restore `&` to its default catcode after, using the following commands. These are are ignored in print mode.

```
\StartDefiningTabulars
<define macros or environments using tabular and &
here>
\StopDefiningTabulars
```

⚠ floatrow

This includes before and after defining any macro which used `\ttabbox` from floatrow.

⚠ `tabular` inside another environment

- When creating a new environment which contains a `tabular` environment, lwarp's emulation of the tabular does not automatically resume when the containing enviroment ends, resulting in corrupted HTML rows. To fix this, use `\ResumeTabular` as follows. This is ignored in print mode.

```
\StartDefiningTabulars  %    (&  is  used  in  a
definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars
```

For developers:

- To automate the use of `\StartDefiningTabulars` and `\EndDefiningTabulars`, these macros may be embedded inside an HTML environment definition to automatically change the catcode of `&` before absorbing the arguments. Another environment may be embedded as well.

```
% Does the work after the catcode has been changed:
\newcommand*{\LWR@HTML@subsomename}[2]{%
  . . .
  \otherenvironmentname  [<args>]  {<args>}  %  for
example
}
% Change catcode before absorbing arguments:
\newcommand*{\LWR@HTML@somename{%
  \StartDefiningTabulars
  \LWR@HTML@subsomename
}
% Change catcode again at the end:
\newcommand*{\LWR@HTML@endsomename}{%
  . . .
  \endotherenvironmentname   % for example
  \StopDefiningTabulars
}
% Combine with the existing print definition:
\LWR@formattedenv{somename}
```

Cell contents:

⚠ macro in a table

- Using a custom macro inside a tabular data cell may result in an extra HTML data cell tag, corrupting the HTML table. To avoid this, use `\TabularMacro` just before the macro. This is ignored in print mode.

```
\TabularMacro\somemacro & more row contents \\
```

Column specifiers:

⚠ math

- Due to the way math is gathered for processing, column specifiers such as `>{$}c<{$}` do not work with lwarp. Instead, each cell must specify math mode individually.

`@` and `!`

- Only one each of `@` and `!` is used at each column, and they are used in that order.

`\multirow`

- In `\multirow` cells, the print version may have extra instances of <, >, `@`, and `!` cells on the second and later rows in the `\multirow` which do not appear in the HTML version.

⚠ `\newcolumntype`

- If `\newcolumntype` does not work for HTML, add a simplified column type using `\HTMLnewcolumntype`.

font and alignment

- lwarp detects each of the following, and sets HTML CSS appropriately:

```
>{\centering\arraybackslash}
>{\raggedright\arraybackslash}
>{\raggedleft\arraybackslash}
>{\itshape}
>{\bfseries}
>{\bfseries\itshape}
```

  These may be used with `\newcolumntype`, such as:

```
\newcolumntype{P}[1]{>{\centering\arraybackslash}p{#1}}
```

Rules:

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.

vertical rules

- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

width and trim

- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with `@` or `!` columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

combined rules

- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:

```
\cmidrule{2-3} \\[-2ex]
\bottomrule
```

The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

⚠ `\warpprintonly`
⚠ Misplaced `\noalign`

- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warpHTML` environment, if a "Misplaced `\noalign`" error occurs, change

```
This & That \endhead
```

to

```
\warpprintonly{This & That \endhead}
```

and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevent to HTML output.

Other:

- tabularx ignores the width, but `X` columns do produce paragraph columns or multicolumns.

`longtable` headings

- For longtable, place headings and footings which do not apply to HTML inside `\warpprintonly{}`.

⚠ S columns

- For S columns (from the siunitx package), while producing print output, anything non-numeric must be placed inside { } braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by lwarp's tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:

```
\warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
\warpHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
```

⚠ `tabular` inside a `<span>`

- In LaTeX, a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

8.10.2 multirow package

vposn

- Note that recent versions of multirow include a new optional `vposn` argument.

multirow cells

- For multirow, insert `\mrowcell` into any empty multi-row cells. This will be a null function for the print output, and is a placeholder for parsing the table for HTML output. An error is generated if this is missed.

```
. . . &  \multirow{2}{.5in}{text}  & . . .
. . . &  \mrowcell                 & . . .
```

colored cells

- The multirow documentation regarding colored cells recommends using a negative number of rows. This will not work with lwarp, so `\warpprintonly` and `\warpHTMLonly` must be used to make versions for print and HTML.

with `\multicolumn`

- See section 429.2 for `\multicolumnrow`.

⚠ `\multicolumn` & `\multirow`

lwarp does not support directly combining `\multicolumn` and `\multirow`. Use `\multicolumnrow` instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for `\multicolumn` come first, followed by the five arguments for `\multirow`, many of which are optional, followed by the contents.

⚠ skipped cells

⚠ empty cells

As per `\multirow`, skipped cells to the right of the `\multicolumnrow` statement are not included in the source code on the same line. On the following lines, `\mcolrowcell` must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

```
. . . &  \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}  & . . .
. . . &  \mcolrowcell          &          \mcolrowcell   & . . .
. . . &  \mcolrowcell          &          \mcolrowcell   & . . .
```

⚠ MathJax

- MathJax does not support multirow, so it is emulated to only print its text on the first row. `\multirow` works as expected in text `tabulars` or SVG math.

8.10.3 longtable package

Pkg longtable

Use one of either `\endhead` or `\endfirsthead` for both print and HTML, and use a `\warpprintonly` macro to disable the other head phrase, and also the `\endfoot` and `\endfirstfoot` phrases. (See section 8.10.4 if using threeparttablex.)

```
\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead   % or \endhead, for print and HTML
\warpprintonly{          % not used in HTML
  [ . . . ] \endhead     % or \endfirsthead
  [ . . . ] \endfoot
  [ <lastfoot macros> ] \endlastfoot
}
. . .  table contents . . .
\warpHTMLonly{
  [ <lastfoot macros> ]   % HTML last footer, without \endfoot
                                          % or \endlastfoot.
}
\end{longtable}
```

⚠ Misplaced `\noalign`

Use the `\warpprintonly` macro instead of the `warpprint` environment. Doing so helps avoid "Misplaced `\noalign`." when using `\begin{warpprint}`.

⚠ `\kill`

`\kill` is ignored, place a `\kill` line inside

```
\begin{warpprint} . . .  \end{warpprint}
```

or place it inside `\warpprintonly`.

⚠ lateximage

longtable is not supported inside a `lateximage`.

8.10.4 threeparttablex package

Pkg threeparttablex

threeparttablex is used with longtable and booktabs as follows:

```
\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead   % or \endhead, for print and HTML
\warpprintonly{          % not used in HTML
  [ . . . ] \endhead     % or \endfirsthead
  [ . . . ] \endfoot
  \bottomrule \insertTableNotes \endlastfoot
}
. . .  table contents . . .
\warpHTMLonly{   % HTML last footer
  \bottomrule
  \UseMinipageWidths     % optional
  \insertTableNotes
  \endlastfoot
}
\end{longtable}
```

table width

The table notes are created using a `\multicolumn`. By default the width is not specified to the browser, so long table notes can cause the table to be spread out horizontally. For HTML output, lwarp guesses the width of the table depending on the number of columns, then restricts its guess to a min/max range. To use this guess for the width of the table notes, use `\UseMinipageWidths` before `\insertTableNotes`. The width is then specified, and in many cases the result is an improvement in overall table layout.

8.10.5 supertabular and xtab packages

Pkg supertabular

Pkg xtab

⚠ Misplaced alignment tab character &

For `\tablefirsthead`, etc., enclose them as follows:

```
\StartDefiningTabulars
\tablefirsthead
. . .
\StopDefiningTabulars
```

See section 8.10.1.

⚠ lateximage

supertabular and xtab are not supported inside a `lateximage`.

8.10.6 colortbl package

Pkg colortbl

⚠ row/cell color

Only use `\rowcolor` and `\cellcolor` at the start of a row, in that order.

colortbl ignores the overhang arguments.

8.10.7 ctable package

⚠ Misplaced alignment tab character &

Use `\StartDefiningTabulars` before one or more `\ctables`, and `\StopDefiningTabulars` after. These change the meaning of the ampersand & character.

8.10.8 bigdelim package

Pkg bigdelim

⚠ use \mrowcell

\ldelim and \rdelim use \multirow, so \mrowcell must be used in the proper number of empty cells in the same column below \ldelim or \rdelim, but not in cells which are above or below the delimiter:

```
\begin{tabular}{lll}
<empty> & a & b \\
\ldelim{\{}{3}{.25in}[left ] & c & d \\
\mrowcell & e & f \\
\mrowcell & g & h \\
<empty> & i & j \\
\end{tabular}
```

<-> a b

left { c d
e f
g h

<-> i j

For MathJax, limited emulation is provided which merely prints the delimter and optional text in the first row.

8.11 Floats

8.11.1 Float contents alignment

⚠ figure & table alignment

\centering, etc. are honored in a figure or table if they are the first command inside the float:

```
\begin{table*}
\centering
\caption{A Table}
. . .
```

8.11.2 float, trivfloat, and/or algorithmicx together

Pkg float

Pkg trivfloat

Pkg algorithmicx

If using \newfloat, trivfloat, and/or algorithmicx together, see section 636.1.

8.11.3 caption and subcaption packages

⚠ package conflicts

Pkg caption

Pkg subcaption

Package options may cause problems with lwarp, especially if they include curley braces.

If selecting options with braces in \usepackage does not work:

```
\usepackage[font={it,small}]{caption}% does not work
```

… try instead selecting the package options before loading lwarp:

```
\PassOptionsToPackage{font={it,small}}{caption}
. . .
\usepackage{lwarp}
. . .
\usepackage{caption}
```

… or try setting package options after the package has been loaded:

```
\usepackage{caption}
\captionsetup{font={it,small}}
```

⚠ numbering To ensure proper float numbering, set caption positions such as:

```
\captionsetup[figure]{position=bottom}
\captionsetup[subfigure]{position=bottom}
\captionsetup[table]{position=top}
\captionsetup[subtable]{position=top}
```

Similarly for longtable. These positions depend on where the user places the `\caption` command inside each float.

8.11.4 subfig package

Pkg subfig

⚠ table numbering To have correct sub table numbers:

```
\usepackage{caption}
\captionsetup[table]{position=top}
```

⚠ lof/lotdepth At present, the package options for `lofdepth` and `lotdepth` are not working. These counters must be set separately after the package has been loaded.

⚠ horizontal spacing In the document source, use `\hfill` and `\hspace*` between subfigures to spread them apart horizontally. The use of other forms of whitespace may cause paragraph tags to be generated, resulting in subfigures appearing on the following lines instead of all on a single line.

8.11.5 floatrow package

Pkg floatrow

Use `\StartDefiningTabulars` and `\StopDefiningTabulars` before and after defining macros using `\ttabbox` with a tabular inside. See section 8.10.1.

⚠ Misplaced alignment tab character &
⚠ subfig package When combined with the subfig package, while inside a `subfloatrow` `\ffigbox` and `\ttabbox` must have the caption in the first of the two of the mandatory arguments.

⚠ `\FBwidth`, `\FBheight` The emulation of floatrow does not support `\FBwidth` or `\FBheight`. These values are pre-set to `.3\linewidth` and `2in`. Possible solutions include:

- Use fixed lengths. lwarp will scale the HTML lengths appropriately.
- Use `warpprint` and `warpHTML` environments to select appropriate values for each case.
- Inside a `warpHTML` environment, manually change `\FBwidth` or `\FBheight` before the `\ffigbox` or `\ttabbox`. Use `\FBwidth` or `\FBheight` normally after-

wards; it will be used as expected in print output, and will use your custom-selected value in HTML output. This custom value will be used repeatedly, until it is manually changed to a new value.

8.11.6 keyfloat package

Pkg keyfloat

⚠ keywrap

If placing a `\keyfig[H]` inside a `keywrap`, use an absolute width for `\keyfig`, instead of `lw`-proportional widths. (The `[H]` option forces the use of a minipage, which internally adjusts for a virtual 6-inch wide minipage, which then corrupts the `lw` option.)

For wrapped figures, overhang and number of lines are ignored.

8.12 KOMA-SCRIPT classes

Cls komascript

Many features are ignored during the HTML conversion. The goal is source-level compatibility.

`\captionformat`, `\figureformat`, and `\tableformat` are not yet emulated.

⚠ Not fully tested!

Please send bug reports!

Some features have not yet been tested. Please contact the author with any bug reports.

8.13 MEMOIR class

Cls memoir

⚠ captions

lwarp uses caption, which causes a warning from memoir. This is normal. Adjust captions via caption, instead of memoir.

⚠ options clash

While emulating memoir, lwarp pre-loads a number of packages (section 692.1). This can cause an options clash when the user's document later loads the same packages with options. To fix this problem, specify the options before loading lwarp:

```
\documentclass{memoir}
. . .
\PassOptionsToPackage{options_list}{package_name}
. . .
\usepackage{lwarp}
. . .
\usepackage{package_name}
```

⚠ version numbers

memoir emulates a number of packages, and declares a version date for each which often does not match the date of the corresponding freestanding package. This can cause warnings about incorrect version numbers. Since lwarp is intended to support the freestanding packages, which are often newer than the date declared by memoir, it is hoped that memoir will update and change its emulated version numbers to match.

`\label(bookmark){tag}`

`\label` accepts an optional `(bookmark)` argument, but this is ignored in HTML.

⚠ comment

The `comment` environment is from the comment package, and thus requires that

the \begin and \end each be on its own line:

```
\begin{comment}
This is a comment.
\end{comment}
```

\newcomment — Comments defined with \newcomment use memoir's defintions, and behave as expected, where the \begin and \end do have to each be on its own line.

⚠ verbatim footnotes — \verbfootnote is not supported.

⚠ \newfootnoteseries — \newfootnoteseries, etc. are not supported.

⚠ page notes — lwarp loads pagenote to perform memoir's pagenote functions, but there are minor differences in \pagenotesubhead and related macros.

page notes with cleveref — To add support for pagenotes with cleveref, add:

```
\crefname{pagenote}{page note}{page notes}
\Crefname{pagenote}{Page note}{Page notes}
```

page note \nameref — Note that for print mode, \nameref print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

⚠ poems — Poem numbering is not supported.

⚠ verbatim — The verbatim environment does not yet support the memoir enhancements. It is currently recommended to load and use fancyvrb instead.

⚠ glossaries — The memoir glossary system is not yet supported by *lwarpmk*. The glossaries package may be used instead, but does require the glossary entries be changed from the memoir syntax to the glossaries syntax.

⚠ framewithtitle, titledframe — The custom frame commands in the memoir manual may be emulated by placing the original defintions in the preamble inside warpprint environments, and then providing an HTML equivalent:

```
\begin{warpHTML}
\newcommand{\FrameTitle}[2]{%
    \textbf{#2}
}

\newenvironment{framewithtitle}[2][\FrameFirst@Lab\ (cont.)]{%
    \begin{fminipage}{\linewidth}
    \textbf{#2}
    \begin{minipage}{\linewidth}
}
{\end{minipage}\end{fminipage}}

\newcommand{\TitleFrame}[2]{%
    \par
    \textbf{#1}\par
    \fboxBlock{#2}
}

\newenvironment{titledframe}[2][\FrameFirst@Lab\ (cont.)]{%
    \par
    \textbf{#2}
```

```
    \begin{fminipage}{\linewidth}
}
{\end{fminipage}}
\end{warpHTML}
```

8.14 International languages

⚠ section and file names

If using *pdflatex* with the setting `\booltrue{FileSectionNames}`, non-ASCII text in section names can result in corrupted HTML file names. *pdflatex* may be used if setting `\boolfalse{FileSectionNames}`, in which case HTML file numbers will be generated.

For correct HTML file names, use *xelatex*, *lualatex*, or dedicated document classes / engines.

(As of this writing, this warning is only relevent to the kotex package.)

8.15 Miscellaneous packages

8.15.1 verse and memoir

Pkg `verse`

Cls `memoir`

`\attrib`

When using verse or memoir, always place a `\\` after each line.

The documentation for the verse and memoir packages suggest defining an `\attrib` command, which may already exist in current documents, but it will only work for print output. lwarp provides `\attribution`, which works for both print and HTML output. To combine the two so that `\attrib` is used for print and `\attribution` is used for HTML:

```
\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}
```

Len `\vleftskip`

Len `\vleftmargini`

Len `\HTMLvleftskip`

Len `\HTMLleftmargini`

These lengths are used by verse and memoir to control the left margin, and they may already be set by the user for print output. New lengths `\HTMLvleftskip` and `\HTMLleftmargini` are provided to control the margins in HTML output. These new lengths may be set by the user before any `verse` environment, and persist until they are manually changed again. One reason to change `\HTMLleftmargini` is if there is a wide `\flagverse` in use, such as the word "Chorus", in which case the value of `\HTMLleftmargini` should be set to a wide enough length to contain "Chorus". The default is wide enough for a stanza number.

⚠ spacing

⚠ `verse` margin

Horizontal spacing relies on *pdftotext*'s ability to discern the layout (`-layout` option) of the text in the HTML-tagged PDF output. For some settings of `\HTMLleftmargini` or `\HTMLleftskip` the horizontal alignment may not work out exactly, in which case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

8.15.2 newclude package

Pkg `newclude`

newclude modifies `\label` in a non-adaptive way, so newclude must be loaded

⚠ loading

before lwarp is loaded:

```
\documentclass{article}
. . . <font setup>
\usepackage{newclude}
\usepackage[warpHTML]{lwarp}
. . .
```

8.15.3 babel package

Pkg babel

⚠ \CaptionSeparator

When French is used, the caption separator is changed to a dash. To restore it to a colon, the following may be placed before lwarp is loaded:

```
\renewcommand*{\CaptionSeparator}{:~}
```

punctuation spaces

⚠ customized spacing

Also when French is used, lwarp creates fixed-width space around punctuation by patching \FBcolonspace, \FBthinspace, \FBguillspace, \FBmedkern, \FBthickkern, \FBtextellipsis, and the tilde. If the user's document also changes these parameters, the user's changes should be placed inside a warpprint environment so that the user's changes do not affect the HTML output.

8.15.4 polyglossia package

Pkg polyglossia

lwarp uses cleveref, which has some limitations when using polyglossia, possibly resulting in the error

```
! Undefined control sequence. . . . \__hook begindocument
```

To test compatibility, add

```
\usepackage{cleveref}
```

near the end of the preamble (as the last package to be loaded), and try to compile the print version. It may be necessary to set

```
\setdefaultlanguage{english}
```

or some other language supported by cleveref, then select other languages using \setotherlanguages.

Once the print version works with cleveref and polyglossia, the HTML version should work as well using lwarp.

8.15.5 todonotes and luatodonotes packages

Pkg todonotes

Pkg luatodonotes

The documentation for todonotes and luatodonotes have an example with a todo inside a caption. If this example does not work it will be necessary to move the todo outside of the caption.

8.15.6 fixme

Pkg fixme

⚠ external layouts

External layouts (\fxloadlayouts) are not supported.

Customized layouts are overwritten by lwarp's versions `\AtBeginDocument` in order to provide the HTML conversion. If creating a new layout, see lwarp's changes to provide similar for the new layout, inside a `warpHTML` environment.

User control is provided for setting the HTML styling of the "faces". The defaults are as follows, and may be changed in the preamble after fixme is loaded:

```
\def\FXFaceInlineHTMLStyle{font-weight:bold}
\def\FXFaceEnvHTMLStyle{font-weight:bold}
\def\FXFaceSignatureHTMLStyle{font-style:italic}
\def\FXFaceTargetHTMLStyle{font-style:italic}
```

8.15.7 acro package

⚠ formats

Define acronymn formats using `\textbf` instead of `\bfseries` etc.

8.15.8 chemfig package

If using `\polymerdelim` to add delimiters to a `\chemfig`, wrap both inside a single `lateximage`:

```
\begin{lateximage}[-chemfig-~\PackageDiagramAltText]
\chemfig{. . . }
\polymerdelim[. . . ]{. . . }
\end{lateximage}
```

8.15.9 chemformula package

⚠ chemformula with MathJax

chemformula works best without MathJax. If MathJax is used, `\displaymathother` must be used before `array`, and then `\displaymathnormal` may be used after. (The chemformula package adapts to `array`, but does not know about MathJax, and MathJax does not know about chemformula.)

While using MathJax, `\displaymathother` may also be used for other forms of display and inline math which contain chemformula expressions.

8.15.10 mhchem package

See section 410.

8.15.11 kotex package

Pkg kotex

⚠ Korean section names

See section 8.14 regarding *pdflatex* and Korean section names.

9 Compiling using custom shell commands

lwarp and *lwarpmk* try to make it easy to process print and HTML compilation tasks in most situations. Depending on the operating system, command-line options, TEX engine, and lwarp options, the commands **`lwarpmk print`** and **`lwarpmk html`** are automatically set up to correctly recompile the project. These actions may be overridden using lwarp options, thus allowing the use of packages such as perltex and pythontex.

9.1 Command options

Opt `PrintLatexCmd`
Opt `HTMLLatexCmd`

The lwarp options `PrintLatexCmd` and `HTMLLatexCmd` are used to set customized commands to be executed by **`lwarpmk print`** and **`lwarpmk html`**.

`PrintLatexCmd` should be set to shell commands which take `project.tex` and generate `project.pdf`.

`HTMLLatexCmd` should be set to take `project_html.tex` and generate `project_html.pdf`. *lwarpmk* will then take `project_html.pdf` and automatically convert it and generate `project.html`.

9.2 Literal character macros

The lwarp package options are parsed by TEX, and so some characters require the use of a special macro to represent them. See table 10. `\LWRopquote` and `\LWRopseq` may be used to increase operating-system portability. `\jobname` must have `_html` appended for processing HTML. `\space` may be necessary between other macros.

⚠ macro not found To use these macros, either kvoptions-patch must be loaded before lwarp:

```
\usepackage{kvoptions-patch}
\usepackage[
    PrintLatexCmd={ ... } ,
    HTMLLatexCmd={ ... }
]{lwarp}
```

Table 10: Literal character macros

Character	Macro	Comment
%	\LWRpercent	
$	\LWRdollar	
&	\LWRamp	
%	\LWRhash	
\	\LWRbackslash	
' or "	\LWRopquote	Depends on the operating system.
& or &&	\LWRopseq	Depends on the operating system.
(space)	\space	Forces an extra space.
(jobname)	\jobname	Without file extension.

or \lwarpsetup must be used to set PrintLatexCmd and HTMLLatexCmd:

```
\usepackage[...]{lwarp}
\lwarpsetup{
  PrintLatexCmd=
      {
          latex tm \LWRopseq
          dvips -o tm-pics.ps tm.dvi \LWRopseq
          ps2pdf -dALLOWPSTRANSPARENCY tm-pics.ps \LWRopseq
          pdflatex tm.tex
      } ,
  HTMLLatexCmd=
      {
          latex tm_html \LWRopseq
          dvips -o tm_html-pics.ps tm_html.dvi \LWRopseq
          ps2pdf -dALLOWPSTRANSPARENCY tm_html-pics.ps \LWRopseq
          pdflatex tm_html.tex
      }
}
```

9.3 *latexmk*

Prog latexmk

If *latexmk* is used for a project, it may be easiest to continue using it.

latexmk project.tex would create project.pdf as normal.

latexmk project_html.tex would create project_html.pdf, then

lwarpmk pdftohtml project_html.pdf would take project_html.pdf and convert it to project.html.

Pkg sagetex

latexmk may simplify the use of packages such as sagetex.

9.4 perltex package

Pkg perltex

The lwarp package option settings to use perltex would be similar to:

```
\usepackage[
  . . .
  PrintLatexCmd={perltex -latex=pdflatex project.tex} ,
  HTMLLatexCmd={perltex -latex=pdflatex project_html.tex} ,
  . . .
]{lwarp}
```

⚠ "impure" math

Place perltex math expressions between `\displaymathother` and `\displaymathnormal`, or `\inlinemathother` and `\inlinemathnormal`. See section 8.7.10.

9.5 pythontex package

Pkg pythontex

An example using pythontex:

```
\usepackage[
  . . .
  PrintLatexCmd={
    pdflatex project.tex \LWRopseq
    pythontex project \LWRopseq
    pdflatex project.tex
  } ,
  HTMLLatexCmd={
    pdflatex project_html.tex \LWRopseq
    pythontex project_html \LWRopseq
    pdflatex project_html.tex
  } ,
  . . .
]{lwarp}
```

Another possibility is to use *latexmk*, placing the **`latexmk . . .`** commands in the `PrintLatexCmd` and `HTMLLatexCmd` options. While using these options, the lwarp option `latexmk` would not be used.

⚠ "impure" math

⚠ HTML look-alike

No attempt has yet been made to make pythontex robust with HTML output. Some math objects must be surrounded by `\displaymathother` ... `\displaymathnormal`, or `\inlinemathother` ... `\inlinemathnormal`. Displays of code may have to be enclosed inside a `lateximage` environment to prevent <, > and similar from being interpreted by the browser as HTML entities.

9.6 sympytex package

Pkg sympytex

For sympytex:

```
\usepackage[
  . . .
  PrintLatexCmd={
    pdflatex project.tex \LWRopseq
    python project.sympy \LWRopseq
    pdflatex project.tex
  } ,
  HTMLLatexCmd={
    pdflatex project_html.tex \LWRopseq
    python project_html.sympy \LWRopseq
    pdflatex project_html.tex
  } ,
  . . .
]{lwarp}
```

Also see the warnings for pythontex, above.

9.7 Other packages

Pkg rterface

Other packages such as rterface would be set up similar to pythontex, and the same warnings would apply.

9.8 *make* program

Prog make

To use lwarp with the *make* program, have the `makefile` take `project.tex` and generate the print version `project.pdf`, as normal. `\usepackage{lwarp}` must be used, and it generates `lwarpmk.conf` when the print version is created.

To generate HTML, first have `project_html.tex` be compiled to generate `project_html.pdf`. This must be in PDF format. Finally, have `project_html.pdf` be converted to HTML using **`lwarpmk pdftohtml project_html.pdf`**, and convert SVG math with **`lwarpmk limages`**.

9.9 UTF-8 locale

⚠ UTF-8 locale

lwarpmk uses the *texlua* program, which sets the "locale" to "C", including for external operating-system calls such as when executing **`lwarpmk html`**. In some cases, an external program called from the user's document may require the use of a UTF-8 "locale". For UNIX-related operating systems, it may be required to use lwarp's custom compilation options to add a locale change:

```
\usepackage{lwarp}[
  PrintLatexCmd={
    env LC_CTYPE=en_US.UTF-8
      xelatex -shell-escape project.tex
  }
  HTMLLatexCmd={
    env LC_CTYPE=en_US.UTF-8
      xelatex -shell-escape project_html.tex
  }
]
```

Pkg ditaa

The only example seen so far where this is required is the ditaa package, where the locale change allows the use of UTF-8 with XeLaTeX and ditaa. To use LuaLaTeX instead, the locale change would have to be made inside the ditaa package where its calls the *ditaa* program.

10 EPUB conversion

lwarp does not produce EPUB documents, but it may be told to modify its HTML output to greatly assist in the conversion. An external program may then be used to finish the conversion to EPUB.

<meta> author

To assign the author's name for regular lwarp HTML files, and also for the EPUB, use `\HTMLAuthor {⟨name⟩}`. This assigns the name to the `<meta>` author element. It may be set empty, and it defaults to `\theauthor`.

A special boolean is provided to simplify the process of converting lwarp HTML output to EPUB:

`FormatEPUB`

Bool `FormatEPUB`
Default: `false`

`FormatEPUB` changes HTML output for easy EPUB conversion via an external program. Removes per-file headers, footers, and nav. Adds footnotes per chapter/section.

To help convert lwarp HTML output to EPUB, add

```
\booltrue{FormatEPUB}
```

to the project's source preamble after `\usepackage{lwarp}`. The EPUB version of the document cannot co-exist with the regular HTML version, so

Enter ⇒ **`lwarpmk cleanall`**

Enter ⇒ **`lwarpmk html`**

Enter ⇒ **`lwarpmk limages`**

to recompile with the `FormatEPUB` boolean turned on. Several changes are then made to the HTML output:

- Headers, footers, and navigation are removed at file splits.
- Any accumulated footnotes are printed at the bottom of each section.

Calibre

The resulting files will be ready to be loaded into an EPUB conversion program, such as the open-source program *Calibre* (`https://calibre-ebook.com/`).

⚠ search order

The EPUB conversion program must know what order the files are included. For lwarp projects, set the EPUB conversion software to do a breadth-first search of the files. For *Calibre*, this option is found in

Preferences → Plugins → File type plugins → HTML to Zip

⚠ encoding

Check the box Add linked files in breadth first order. Set the document encoding as `utf-8`, which is what lwarp generates for HTML, even if the original printed document uses some other encoding.

⚠ section breaks

The EPUB-conversion program must also know where the section breaks are located. For a list of lwarp's section headings, see table 12. For example, an `article` class document would break at `\section`, which is mapped to HTML heading level

<h4>, whereas a book class document would break at \chapter, which is HTML heading level <h3>. For *Calibre*, this option is found in

Preferences → Conversion (Common Options) → Structure Detection → Detect chapters at (XPath expression)

Select the "magic wand" to the right of this entry box, and set the first entry

Match HTML tags with tag name:

to "h4". (Or "h3" for document classes with \chapters.) The Detect chapters at field should then show

//h:h4 — or — **//h:h3**

This option is also available on the main tool bar at the Convert books button.

Once these settings have been made, the lwarp-generated HTML files may be loaded by *Calibre*, and then converted to an EPUB.

MathJax support

MathJax may be used in EPUB documents. Some e-readers include MathJax, but any given reader may or may not have a recent version, and may or may not include extensions such as support for siunitx.

lwarp adds some modifications to MathML to support equations numbered by chapter. These modifications may not be compatible with the e-reader's version of MathJax, so lwarp requests that a known version be loaded instead. In some cases chapter numbering of equations still doesn't work.

Until math support in EPUB documents is improved, it is recommended to use SVG images instead of MathJax, especially for equations numbered by chapter, or where siunitx support is important.

11 Word-processor conversion

lwarp may be told to modify its HTML output to make it easier to import the HTML document into a word processor. At the time of this writing, it seems that LibreOffice works best at preserving table layout, but it still has some limitations, such as an inability to automatically assign figure and table frames and captions according to user-selected HTML classes. lwarp provides some assistance in locating these frame boundaries, as shown below.

11.1 Activating word-processor conversion

A special boolean is provided to simplify the process of converting lwarp HTML output to EPUB:

`FormatWP`

Bool `FormatWP`
Default: `false`

Changes HTML output for easier conversion by a word processor. Removes headers and nav, prints footnotes per section, and also forces single-file output and turns off HTML debug comments. Additionally, honors the booleans `WPMarkFloats`, `WPMarkMinipages`, `WPMarkTOC`, and `WPMarkLOFT`.

To help modify lwarp HTML output for easier import to a word processor, add

```
\booltrue{FormatWP}
```

to the project's source preamble after lwarp is loaded. The following changes are then made to the HTML output:

formatting adjustments

- If using a class without chapters, `\section` and lower are shifted up in level for the HTML heading tags. The CSS has not been changed, so the section heading formats will not match the normal HTML output, but when imported to *LibreOffice Writer* the higher section headings will import as **Heading 1** for the title, **Heading 2** for `\section`, etc.
- Headers, footers, and navigation are removed at file splits.
- Any accumulated footnotes are printed at the bottom of each section.
- Forces single-file output.
- Turns off HTML debugging comments. These are comments appearing inside the HTML code, marking the opening/closing of sections and `<div>`s, but they are no longer useful when the document has been imported into a word processor.
- An additional `<div>` with an `id` encapsulates each float and minipage, which on import into *LibreOffice Writer* causes a thin frame to appear around the text block for each.
- Float captions are given an explicit italic formatting.
- Tabular rule borders are made explicit for *LibreOffice Writer*. LibreOffice displays a light border around each cell while editing, even those which have

no border when printed, and lwarp also uses a light border for thin rules, so it will be best to judge the results using the print preview instead of while editing in LibreOffice.

- `\includegraphics` and SVG math width and height are made explicit for LibreOffice.
- `\hspace` is approximated by a number of `\quad`s, and rules are approximated by a number of underscores.
- Explicit HTML styles are given to:
  - `\textsc`, etc.
  - `\underline`, soul and ulem markup.
  - `center`, `flushleft`, `flushright`.
  - `\marginpar`, keyfloat, sidenotes, floatflt, and wrapfig.
  - fancybox `\shadowbox`, etc.
  - The LaTeX and TeX logos.
- Honors several booleans:

  WPMarkFloats: Marks the begin and end of floats.

  WPMarkMinipages: Marks the begin and end of minipages.

  WPMarkTOC: Marks the location of the Table of Contents.

  WPMarkLOFT: Marks the locations of the List of Figures/Tables.

  WPMarkMath: Prints LaTeX math instead of using images.

  WPTitleHeading: Adjusts title and section headings.

  Several of these may be used to add markers to the HTML text which help determine where to adjust the word processor document after import.

11.2 Additional modifications

`WPMarkFloats`

Bool `WPMarkFloats`
Default: `false`

Adds

```
=== begin table ===
. . .
=== end ===
```

or

```
=== begin figure ===
. . .
=== end ===
```

around floats while formatting for word processors. This helps identify boundaries of floats to be manually converted to word-processor frames and captions.

`WPMarkMinipages`

Bool `WPMarkMinipages`
Default: `false`

Adds

```
=== begin minipage ===
. . .
=== end minipage ===
```

around minipages while formatting for word processors. This helps identify boundaries of minipages to be manually converted to word-processor frames.

WPMarkTOC

Bool WPMarkTOC
Default: true

While formatting for word processors, adds

```
=== table of contents ===
```

where the Table of Contents would have been. This helps identify where to insert the actual TOC.

If set `false`*, the actual toc is printed instead.*

WPMarkLOFT

Bool WPMarkLOFT
Default: false

While formatting for word processors, adds

```
=== list of figures ===    and/or
=== list of tables ===
```

where each of these lists would have been. This helps identify where to insert the actual lists.

If set `false`*, the actual lists are printed instead.*

WPMarkMath

---

siunitx

Bool WPMarkMath
Default: false

Prog TeXMaths

While formatting for word processors, prints math as LaTeX code instead of creating SVG images or MathJax. This is useful for cut/paste into the *LibreOffice Writer TeXMaths* extension.

When using the siunitx package, enter

```
\usepackage{siunitx}
```

in the *TeXMaths* preamble. Equation numbering is problematic for $\mathcal{AMS}$ math environments.

WPTitleHeading

Bool WPTitleHeading
Default: false
section headings

While formatting for word processors, `true` sets the document title to `<h1>`, which is expected for HTML documents, but also causes the lower-level section headings to start at **Heading 2** when imported into LibreOffice. Set to `false` to cause the title to be plain text, and the section headings to begin at **Heading 1**.

Table 11: Section HTML headings for word-processor conversion

	HTML headings*			
	With \chapter		Without \chapter	
	WPTitleHeading		WPTitleHeading	
Section	true	false	true	false
Title	<h1>	plain	<h1>	plain
\book				
\part	<h2>	<h1>	<h2>	<h1>
\chapter	<h3>	<h2>	—	—
\section	<h4>	<h3>	<h3>	<h2>
\subsection	<h5>	<h4>	<h4>	<h3>
\paragraph	<h6>	<h5>	<h5>	<h4>
\subparagraph		<h6>	<h6>	<h5>

* For default depths when not FormatWP, see table 12 on page 199.

See table 11 on page 183.

11.3 Recommendations

TOC, LOF, LOT

For use with *LibreOffice Writer*, it is recommended to:

1. Set \booltrue{FormatWP}
2. Set \booltrue{WPMarkTOC} and \boolfalse{WPMarkLOFT}
3. Use lwarp to generate the HTML document.
4. Copy/paste from the HTML document into an empty *LibreOffice Writer* document.
5. Manually insert a LibreOffice TOC in the LibreOffice document.
6. Manually add frames around each float, adding a caption which is cut/pasted from each float's simulated caption.
7. Manually create cross references.

This process yields a document with an actual LibreOffice Table of Contents, but a simulated List of Figures and List of Tables.

siunitx

For siunitx, remember to adjust the preamble as mentioned above.

LO view border options

LibreOffice has options in the **View** menu to turn on/off the display of thin borders around table cells and text objects.

11.4 Limitations

Floats and captions are not explicitly converted to LibreOffice floats with their own captions. Floats are surrounded by a thin frame in the LibreOffice editor, and may be marked with `WPMarkFloats`, but are not given a proper LibreOffice object frame. Captions are given an explicit italic formatting, but not a proper LibreOffice paragraph style.

Cross references are not actual LibreOffice linked cross references.

The List of Figures and List of Tables are not linked. The pasted pseudo LOF and LOT match the numbering of the LaTeX and HTML versions.

Equation numbering is not automatic, but the equation numbers in SVG math will match the LaTeX and HTML output. SVG math is recommended when using the $\mathcal{AMS}$ environments, which may have multiple numbered equations per object.

As of when last checked, LibreOffice ignores the following:

- Minipage alignment.
- Tabular cell vertical alignment.
- Image rotation and scaling.
- Rounded border corners, which are also used by:
  - `\textcircled`
  - booktabs trim
- `\hspace` and rules, also used by algorithmic.
- Coloring of text decorations, used by soul and ulem.
- Overline text decoration, used by romanbar.

LibreOffice also has limitations with frames and backgrounds:

- Multiple lines in an object are framed individually instead of as a whole.
- Nested frames are not handled correctly.
- Images inside boxes are not framed correctly.
- Spans with background colors and frames are not displayed correctly.

12 Modifying lwarp

locating something

To quickly find the source for a package in `lwarp.dtx`, search for `*packagename`, such as `*siunitx`.

Likewise, to quickly find the source for a file in `lwarp.dtx`, search for `*filename`, such as `*lwarp.css`.

Purely text-based packages probably will work as-is when generating HTML.

Look to existing code for ideas on how to expand into new code.

image of TEX output

An environment may be converted to a `lateximage` then displayed with an image of the resulting LATEX output. See section 93 for an example of the `picture` environment.

css classes

To create a custom HTML block or inline CSS class, see section 52.10.

print/HTML macros

To create print and HTML versions of the same macro or environment, see section 36.

⚠ TEX boxes

Any TEX boxes must be undone, as SVG math or `lateximages` require `\newpage`, which will not work in a TEX box.

12.1 Creating a development system

The following creates a local development system for lwarp on a TeXLive system in a UNIX-like environment. Doing so allows anything requesting lwarp to use the development version instead of whichever version is installed in TeXLive.

Create a development directory:

Place into this directory `lwarp.dtx` and `lwarp.ins`.

To create `lwarp.sty`, execute

Enter ⇒ **`pdflatex lwarp.ins`**

which creates `lwarp.sty` and several hundred additional `lwarp-*.sty` files for the various packages which are supported.

To create the initial documentation `lwarp.pdf`, execute

Enter ⇒ **`pdflatex lwarp.dtx`**

To make the development files visible to other projects:

Create the directory

```
/usr/local/texlive/texmf-local/tex/latex/local/lwarp
```

Inside this directory, create the file `update`, containing:

```
rm lwarp-*.sty
ln -s /path_to_dev_directory/lwarp*.sty .
ln -s /path_to_dev_directory/lwarp_baseline_marker.png .
ln -s /path_to_dev_directory/lwarp_baseline_marker.eps .
mktexlsr
```

Run ./update now, and whenever a new lwarp-* package is added.

To make the development version of *lwarpmk* visible to other projects:

```
cd /opt
ln -s /usr/local/texlive/texmf-local/bin/x86_64-linux texbin_local
cd texbin_local
ln -s ../../scripts/lwarp/lwarpmk.lua lwarpmk
cd /usr/local/texlive/texmf-local/scripts/
mkdir lwarp
cd lwarp
ln -s /path_to_dev_directory/lwarpmk.lua lwarpmk
```

Verify that the correct version is found with

Enter ⇒ **`which lwarpmk`**

To make the local versions visible to the shell:

Paths must be set by the shell startup, such as in `.bashrc` and `.cshrc`:

In `.bashrc`:

```
PATH=/opt/texbin_local:/opt/texbin:$PATH
```

In `.cshrc`:

```
setenv PATH ${HOME}/bin:/opt/texbin_local:/opt/texbin:${PATH}
```

To fully compile the lwarp documentation and indexes:

```
pdflatex lwarp.ins
pdflatex lwarp.dtx
pdflatex lwarp.dtx                          <if necessary>
makeindex -s gglo.ist -o lwarp.gls lwarp.glo   <indexes>
splitindex lwarp.idx - -s gind.ist
pdflatex lwarp.dtx
pdflatex lwarp.dtx                          <if necessary>
makeindex -s gglo.ist -o lwarp.gls lwarp.glo   <indexes>
splitindex lwarp.idx - -s gind.ist             <again>
pdflatex lwarp.dtx
pdflatex lwarp.dtx                          <if necessary>
```

(The second round of index processing is required to fully resolve the final Index of Indexes.)

To make it easier to update the documentation after a minor change, it is useful to create a command script called `make_index`, containing:

```
makeindex -s gglo.ist -o lwarp.gls lwarp.glo
splitindex lwarp.idx -- -s gind.ist
```

⚠ references

Note that Index of Indexes and the cross-references to the indexes may not be correct until the above has been accomplished.

12.2 Modifying a package for lwarp

If a class loads additional packages, it will be required to modify the class for lwarp, since lwarp must be loaded before most other packages.

To work with lwarp, a class must first set up anything which replicates the functions of the basic LaTeX classes, load any required fonts, then load lwarp, then finally load and adjust any other required packages.

When creating HTML, lwarp redefines the `\usepackage` and `\RequirePackage` macros such that it first looks to see if a `lwarp-<packagename>.sty` version exists. If so, the lwarp version is used instead. This modular system allows users to create their own versions of packages for lwarp to use for HTML, simply by creating a new package with a `lwarp-` prefix. If placed in the local directory along with the source code, it will be seen by that project alone. If placed alongside the other `lwarp-` packages where TeX can see it, then the user's new package will be seen by any documents using lwarp. (Remember `mktexlsr` or `texhash`.)

An `lwarp-<packagename>.sty` package is only used during HTML generation. Its purpose is to pretend to be the original package, while modify anything necessary to create a successful HTML conversion. For many packages it is sufficient to simply provide nullified macros, lengths, counters, etc. for anything which the original package does, while passing the raw text on to be typeset. See the pre-existing `lwarp-` packages for examples.

Anything the user might expect of the original package must be replaced or emulated by the new `lwarp-` package, including package options, user-adjustable counters, lengths, and booleans, and conditional behaviors. In many of these packages, most of the new definitions have a "local" prefix according to the package name, and `@` characters inside the name, which hides these names from the user. In most cases these macros will not need to be emulated for HTML output. Only the "user-facing" macros need to be nullified or emulated.

Each `lwarp-*` package should first call either of:

```
\LWR@ProvidesPackageDrop
  — or —
\LWR@ProvidesPackagePass
```

If "`Drop`"ped, the original print-version package is ignored, and only the `lwarp-` version is used. Use this where the original print version is useless for HTML. If "`Pass`"ed, the original package is loaded first, with the user-supplied options, then the `lwarp-` version continues loading as well. See section 457 (ntheorem) for an example of selectively disabling user options for a package. Use this when HTML output only requires some modifications of the original package. For a case where the original package is usable without changes, there is no need to create a `lwarp-` version.

12.2.1 Adding a package to the lwarp.dtx file

When adding a package to `lwarp.dtx` for permanent inclusing in lwarp, provide the `lwarp-<packagename>` code in `lwarp.dtx`, add its entry into `lwarp.ins`, and also remember to add

```
\LWR@loadafter{<packagename>}
```

to `lwarp.dtx` in section 20.1. This causes lwarp to stop with an error if packagename is loaded before lwarp. Finally, add an entry in table 2, Supported packages and features, and also the Updates section.

12.3 Modifying a class for lwarp

If a class loads additional packages, it will be required to modify the class for lwarp, since lwarp must be loaded before most other packages.

To work with lwarp, a class must first set up anything which replicates the functions of the basic LaTeX classes, load any required fonts, then load lwarp, then finally load and adjust any other required packages.

12.4 Testing lwarp

Compiling `lwarp.ins` generates all the `*.sty` files for lwarp. It can be useful to create additional `*.ins` files to be able to recompile only the pieces which have changed.

compiling individual packages

For example, to be able to recompile the lwarp core alone, copy `lwarp.ins` to `core.ins`, then modify `core.ins` to only compile:

File `core.ins`

```
\generate{
\file{lwarp.sty}{\from{lwarp.dtx}{package}}
}
```

For individual packages, create `packagename.ins`, set to compile only:

```
\generate{
\file{lwarp-packagename.sty}{\from{lwarp.dtx}{packagename}}
}
```

When changes have been made, test the print output before testing the HTML. The print output compiles faster, and any errors in the printed version will be easier to figure out than the HTML version.

compiling css and other generated files

Remember that the configuration files are only rewritten when compiling the printed version of the document.

When changing the source to *lwarpmk* or a CSS file in `lwarp.dtx`:

1. Change the source in `lwarp.dtx`.
2. `pdflatex lwarp.ins` -or- `pdflatex core.ins`
3. `pdflatex lwarp.dtx`
4. If modifying *lwarpmk* the new version should now be active.
5. If modifying CSS files or other files generated by lwarp:
   (a) For the document, `lwarpmk print` to update the CSS files in the project.
   (b) Reload the HTML document to see the effect of the new CSS files.

Sometimes it is worth checking the <project>_html.pdf file, which is the PDF containing HTML tags. Also, <project>_html.html has the text conversion of these tags, before the file is split into individual HTML files.

It is also worth checking the browser's tools for verifying the correctness of HTML and CSS code.

12.5 Modifying *lwarpmk*

Prog lwarpmk
File lwarpmk.lua

In most installations, lwarpmk.lua is an executable file located somewhere the operating system knows about, and it is called by typing **lwarpmk** into a terminal.

A project-local copy of lwarpmk.lua may be generated, modified, and then used to compile documents:

1. Add the lwarpmk option to the lwarp package.
2. Recompile the printed version of the document. The lwarpmk option causes lwarp to create a local copy of lwarpmk.lua
3. The lwarpmk option may now be removed from the lwarp package.
4. Copy and rename lwarpmk.lua to a new file such as mymake.lua.
5. Modify mymake.lua as desired.
6. If necessary, make mymake.lua executable.
7. Use mymake.lua instead of lwarpmk.lua.

13 Troubleshooting

13.1 lwarp package error conditions and warnings

lwarp tests for a number of error conditions and prints appropriate warnings. The following is a summary of these conditions.

13.1.1 Configuration file `lwarpmk.conf`

File does not exist: The configuration file must exist for lwarpmk.

Incorrect `Unix` /`Windows` selection: The operating system which was detected by lwarp. So far only `Unix` and `Windows` are supported.

Incorrect delimiter characters. Older versions of *lwarpmk* used a different delimiter.

Source name is set to `lwarp`: lwarp has recently been recompiled in this directory, which overwrote the project's configuration files. This also occurs if *lwarpmk* is executed in lwarp's source directory.

Incorrect operating system: The configuratio file was set for a different operating system, perhaps due to sharing in a collaborative project.

Outdated configuration files: lwarp has been updated since this projects was last compiled. If there appears to be a valid print command in the file, lwarpmk displays this to instruct the user how to recompile the print version, which then updates the configuration files.

The designated source file does not exist: For whatever reason…

Unknown engine: lwarp cannot determing which engine is being used. Supported are DVI LaTeX, PDF LaTeX, XeLaTeX, LuaLaTeX, and upLaTeX.

13.1.2 Image generation with `lwarpmk limages`

"Wait a moment for the images to complete before reloading page.":

Images are generated by background tasks. If the document is reloaded before these tasks are complete, some images may not yet be generated. *lwarpmk* tries to wait for background tasks to complete before exiting.

HTML version does not exist: Images are extracted from the HTML version, which must be compiled before images are generated.

`*-images.txt` does not exist: This file tells which images to extract from the HTML file. If the file does not exist, it may be that no SVG math or `lateximages` were used. If so, **`lwarpmk limages`** is not necessary.

Cross references are not correct: The document must have up-to-date cross references to locate the images to extract. A number of conditions may cause incorrect cross references.

"WARNING: Images will be incorrect.": An image reference was not found. Recompile.

`lwarpmk epstopdf *` or `lwarpmk pdftosvg *`: Errors if filenames are not found.

13.1.3 Default bitmapped font

lwarp requires the use of a vector font. If lwarp detects that the document uses the default COMPUTER MODERN font, and the cm-super package is not installed, it is assumed that the font is bitmapped. An error is generated, along with the recommendation to install cm-super or use lmodern.

13.1.4 Packages

Loaded before lwarp: Some packages and classes must be loaded before lwarp. These include input and font encoding, morewrites and newclude, and a number of CJK-related packages and classes.

Loaded after lwarp: Most packages which are modified by lwarp must be loaded after lwarp.

Loaded never: Some packages do not work with lwarp. An error is generated, along with a list of alternatives to consider.

Specific packages: Some packages enforce a specific load order vs. certain other packages.

Patching error: lwarp tries to patch some packages using xpatch. If the original package has been updated more recently than lwarp, a patch may not work. It may be necessary to use an older version of the package until lwarp is updated.

longtable: lwarp's longtable package issues detailed error messages regarding the use of the table headers and footers.

polyglossia: If used, an informative message is printed to instruct the user to be sure to set a language, without which an error will occur.

babel or polyglossia: An informative message is printed to note that not all langauges are supported by cleveref.

13.1.5 Compiling

`SideTOCDepth` < `FileDepth`: A warning is displayed if these counters are set such that the sideTOC will not be able to access all pages of the website.

Filenames: lwarp may generate file names from section names. While doing so, the filenames are simplified, and special characters and math are removed. If this process generates a duplicate filename, and error is generated, describing the filename and which section name generated it. A warning is issued if dollar-delimited math is used. Parenthesis-delimited math is recommended instead.

⚠ HTML corrupted **Multirow:** When `\multirow` or `\multicolrow` are used, `\mrowcell` or `\mcolrowcell` must be placed in the appropriate cells to avoid corrupted HTML output.

(width,height) missing a comma: `\makebox` and `\framebox` can accept a parenthesis-delimited width and height, which must be separated by a comma.

"Load graphicx or graphics for improved SVG math baselines.": SVG math sizing and baselines are improved if either of these packages are used.

"Load graphicx or graphics for improved XeTeX logo.": If these packages are loaded, the XeLaTeX logo can use the reversed "E".

"It is recommended to use `[width=xx\linewidth]` instead of `[scale=yy]` ": Browser support of `scale` does not have the same effect as in LaTeX.

13.2 Using the lwarp package

The following address problems which may occur, and possible solutions to each.

Also see:
Section 7.11: Commands to be placed into the `warpprint` environment
Section 8: Special cases and limitations

⚠ HTML corrupted **Text is not converting correctly / corrupted HTML tags:**

- Font-related UTF-8 information must be embedded in the PDF file. See section 7.4 regarding bitmapped vs. vector fonts.
- See section 8.2.1 regarding HTML entities and the characters &, <, and >.

⚠ dotlessj **Dotless j (`\j`):** See section 7.4 regarding cmap, mmap.

Undefined HTML settings:

- See the warning regarding the placement of the HTML settings at section 7.6.

Tabular problems: See section 8.10.1.

Obscure error messages:

Print first: Be sure that a print version of the document compiles and that your document's LaTeX code is correct, before attempting to generate an HTML version.

`\end{warpHTML}, \end{warpprint}, \end{warpall}, \end{warpMathJax}`:

⚠ `warpHTML`, `warpprint`, `warpMathJax`, `warpall`

Each of these must be without any other characters on the same line.

"`Runaway argument? File ended while scanning use of \next`: Don't use `warpHTML`, `warpprint`, `warpall`, or `warpMathJax` inside itself.

Options clash: If using memoir, see section 8.13.

"Missing `\begin{document}`.": Some packages require that their options be specified before lwarp is loaded, or via the package's setup macro, especially if these options include the use of braces. See section 8.1.

"No room for a new `\write`.": Before `\usepackage{lwarp}`, add:

```
\usepackage{morewrites}
\morewritessetup{allocate=10}
```

"! TeX capacity exceeded, sorry [text input levels=15].": Packages were nested too many levels deep. Locate the file `texmf.cnf` for your distribution, and add the line

```
max_in_open = 30
```

"Missing $ inserted.": If using a filename or URL in a footnote or `\item`, escape underscores with `\_`.

"Label(s) may have changed. Rerun to get cross-references right.":
This warning may repeat endlessly if a math expression is used in a caption. Simple math expressions such as $X=1$ may be replaced with

```
\textit{X}\,=\,1
```

"Temporary page! LaTeX was unable to guess the total number of pages ...":
Harmless. Recompile the document one more time.

"Leaders not followed by proper glue":
This can be caused by a missing `l@<floattype>` or `l@<sectiontype>` definition. See lwarp's definitions for examples.

"Improper \prevdepth": `lateximages` and SVG math require `\newpage`, which cannot work inside TEX boxes or `\ensuremath`. Anything using `\newsavebox`, `\newbox`, `lrbox`, `\savebox`, `\hbox`, `\vbox`, `\usebox`, `\sbox`, etc., must be modified to work without box commands.

If you find something using `\ensuremath`, have it temporarily set:

```
\LetLtxMacro\@ensuredmath\LWR@origensuredmath
```

inside a group first.

`LWR@texboxdepth`

As a stop-gap measure, you may wish to try incrementing the counter `LWR@texboxdepth` before the problematic macro, and then decrementing it after. Doing so tells lwarp to avoid using a `\newpage` inside the macro, which may avoid this error.

⚠ macros in section, table, figure names

Also, custom macros which appear inside a section, figure, or table name should be made robust since they appear inside the `.toc`, `.lof`, or `.lot` files. Use `\newrobustcmd` or `\robustify` from etoolbox, xparse, etc.

⚠ BibTeX

If using BibTeX, see section 8.6.9.

⚠ polyglossia

"! Undefined control sequence. . . . __hook begindocument":
See section 8.15.4 if using polyglossia.

⚠ custom macros for environments

"\begin{equation} ended by \end{document}": Do not use custom macros such as `\beq` and `\eeq` to replace

```
\begin{equation}
. . .
\end{equation}
```

⚠ `\LWR@formatted`

"Misplaced \omit": If using `\LWR@formatted` to define new macros for print and HTML modes, see section 36 regarding `\LWR@expandableformatted`.

"Token not allowed in a PDF string": This hyperref warning appears while creating the print-mode document, not HTML. A low-level macro is being used in a section name which appears in the PDF bookmarks. hyperref removes this macro from the bookmark, and warns of doing so. To avoid this warning, use `\pdfstringdefDisableCommands` in the preamble to define simplified replacement macros for each, or use `\texorpdfstring` in the `\section` or related macro to declare what to use for the TEX text, v.s. the PDF bookmark. See the hyperref manual.

⚠ quote character

"Command \textquoteright invalid in math mode": This can occur when the document source has math containing the slanted quote ' character, instead of using the upright quote ' character.

⚠ "impure" math objects

Complicated objects inside math: Some objects, such as Ti*k*z, may not compile in lwarp's normal math emulation. Insert

`\displaymathother` —*or*— `\inlinemathother`

before the math, and then

`\displaymathnormal` —*or*— `\inlinemathnormal`

when displaying "normal" math. See section 8.7.10.

Slow compliation of math objects: Complicated math objects can also cause problems with `alt` tags, resulting in very slow compilation, large `alt` tags, and possible crashes. Use `\inlinemathother` ... `\inlinemathnormal` or `\displaymathother` ... `\displaymathnormal` around the math expression.

⚠ MathJax **Incorrect MathJax:** Some objects do not convert to MathJax. Use `\displaymathother` before these objects, then `\displaymathnormal` to return to "normal" display math. See section 8.7.10.

Missing sections: See section 7.6 regarding the `FileDepth` and `SideTOCDepth` counters, and the use of `\tableofcontents` in the home page.

Misnumbered footnotes from section headings: See section 8.5.4.

Missing HTML files:

- See the warning regarding changes to the HTML settings at section 7.6.
- Ensure that the filenames are unique after math and short words are removed. See `FileSectionNames` at section 7.6.

Missing / incorrect cross-references:

- Use `lwarpmk again` followed by `lwarpmk html` or `lwarpmk print` to compile the document one more time.
- labels
  ⚠ label characters
  Labels with special characters may be a problem. It is best to stick with alpha-numeric, hyphen, underscore, and perhaps the colon (if not French).

  `\nameref` refers to the most recently-used section where the `\label` was defined. If no section has been defined before the `\label`, the link will be empty. Index entries also use `\nameref` and have the same limitation.

  `\nameref`
  ⚠ empty link
- ⚠ cleveref page numbers
  cleveref and varioref are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for `\cpageref` and `\cpagerefrange`. This phrase includes `\cpagerefFor`, which defaults to "for".

  Ex:

  ```
  \cpageref{tab:first,tab:second}
  ```

  in `html` becomes:

  "pages **for** table 4.1 and **for** table 4.2"

  See `\cpagerefFor` at page 730 to redefine the message which is printed for page number references.

BibTeX errors with `\etalchar`: See section 8.6.9.

Malformed URLs: Do not use the `%` character between arguments of `\hyperref`, etc., as this character is among those which is neutralized for inclusion in HTML URLs.

Em-dashes or En-dashes in listing captions and titles:

Use XeLaTeX or LuaLaTeX.

Floats out of sequence:

Mixed "Here" and floating: Floats [H]ere and regular floats may become out of order. `\clearpage` if necessary.

Caption setup: With `\captionsetup` set the positions for the captions `above` or `below` to match their use in the source code.

Images are appearing in strange places:

- When images are added or removed, Enter **`lwarpmk limages`** to refresh the `lateximage` images.

SVG images:

⚠ adding/removing

When a math expression, `picture`, or Ti*k*z environment is added or removed, the SVG images must be re-created by entering **`lwarpmk limages`** to maintain the proper image-file associations. Inline SVG math may be hashed and thus not need to be recreated, but display math and objects such as Ti*k*z may move to new image numbers when the document is changed.

recompile first

Before attempting to create the SVG image files, *lwarpmk* verifies that the HTML version of the document exists and has correct internal image references.[16] If it is necessary to recompile the document's HTML version one more time, *lwarpmk* usually will inform the user with an error message, but there are some conditions which cannot be detected, so the user should watch for the LaTeX recompile warnings.

⚠ HTML instead of images

If HTML appears where an SVG image should be, recompile the document one more time to get the page numbers back in sync, then remake the images one more time.

⚠ page counter

Incorrect SVG images will also occur if the document changes the `page` counter:

```
\setcounter{page}{<value>}
```

The `page` counter must *not* be adjusted by the user.

⚠ Lots of files!

Expressing math as SVG images has the advantage of representing the math exactly as LaTeX would, but has the disadvantage of requiring an individual file for each math expression. For inline math, and some other objects, lwarp uses an MD5 hash on its LaTeX source to combine multiple instances of identical inline expressions into a single image file, but display math and other environments such as `picture` and Ti*k*z require one image file each. For a document with a large amount of math, see section 5.5 to use MathJax instead.

Plain-looking document:

- The document's CSS stylesheet may not be available, or may be linked incorrectly. Verify any `\CSSFilename` statements point to a valid CSS file.

⚠ HTML corrupted

Broken fragments of HTML:

- Check the PDF file used to create HTML to see if the tags overflowed the margin. (This is why such large page size and margins are used.)

Changes do not seem to be taking effect:

[16] This becomes important when dealing with a document containing thousands of images.

- Be sure to `lwarpmk clean`, recompile, then start by reloading the home page. You may have been looking at an older version of the document. If you changed a section name, you may have been looking at the file for the old name.
- See the warning regarding changes to the HTML settings at section 7.6.
- Verify that the proper CSS is actually being used.
- The browser may compensate for some subtle changes, such as automatically generating ligatures, reflowing text, etc.

Un-matched conditional compiles:

- Verify the proper `begin`/`end` of `warpprint`, `warpHTML`, and `warpall` environments.

13.2.1 Debug tracing output

`\tracinglwarp`

When `\tracinglwarp` is used, lwarp will add extra tracing messages to the `.log` file. The last several messages may help track down errors.

Place `\tracinglwarp` just after `\usepackage{lwarp}` to activate tracing.

13.3 Compiling the `lwarp.dtx` file

`lwarp_tutorial.tex`: Copy or link `lwarp_tutorial.txt` from the TDS doc directory to the `source` directory, or wherever you wish to compile the documentation. This file is included verbatim in the documentation, but is in the `doc` directory so that it may be found by *texdoc* and copied by the user.

Illogical error messages caused by an out-of-sync `lwarp.sty` file:

1. Delete the `lwarp.sty` file.
2. Enter **`pdflatex lwarp.ins`** to generate a new `lwarp.sty` file.
3. Enter **`pdflatex lwarp.dtx`** to recompile the `lwarp.pdf` documentation.

Un-nested environments:

Be sure to properly nest:

- `\begin{macrocode}` and `\end{macrocode}`
- `\begin{macro}` and `\end{macro}`
- `\begin{environment}` and `\end{environment}`

15 Implementation

This package is perhaps best described as a large collection of smaller individual technical challenges, in many cases solved through a number of ~~crude hacks~~ clever tricks. Reference sources are given for many of the solutions, and a quick internet search will provide additional possibilities.

Judgement calls were made, and are often commented. Improvements are possible. The author is open to ideas and suggestions.

Packages were patched for re-use where they provided significant functionality. Examples include xcolor with its color models and conversion to HTML color output, and siunitx which provides many number and unit-formatting options, almost all of which are available in pure-text form, and thus easily used by *pdftotext*.

Packages were emulated where their primary purpose was visual formatting which is not relevent to HTML output. For example, packages related to sectioning are already patched by numerous other packages, creating a difficult number of combinations to try to support, and yet in HTML output all of the formatting is thrown away, so these packages are merely emulated.

Packages with graphical output are allowed as-is, but must be nested inside a `lateximage` environment to preserve the graphics.

Testing has primarily been done with the Iceweasel/Firefox browser.

Table 12: Section depths and HTML headings

Section	LaTeX depth	HTML headings *
Title of the entire website		`<h1>`

subsection	2	`<h5>`
subsubsection	3	`<h6>`
paragraph	4	`<span class = "paragraph">`
subparagraph	5	`<span class = "subparagraph">`
listitem	7	new for this package, used for list items

* If `FormatWP` is true, section headings may be adjusted, depending on `WPTitleHeading`. See table 11 on page 183.

16 Section depths and HTML headings

Stacks are created to track depth inside the LaTeX document structure. This depth is translated to HTML headings as shown in table 12. "Depth" here is not depth in the traditional computer-science stack-usage sense, but rather a representation of the nesting depth inside the LaTeX document structure.

When starting a new section, the program first must close out any existing sections and lists of a deeper level to keep the HTML tags nested correctly.

Support for the memoir package will require the addition of a `book` level, which may push the HTML headings down a step, and also cause `subsubsection` to become a `<div>` due to a limit of six HTML headings.

It is possible to use HTML5 `<section>` and `<h1>` for all levels, but this may not be well-recognized by older browsers.

Fixed levels for parts and chapters allow the CSS to remain fixed as well.

17 Source code

This is where the documented source code for lwarp begins, continuing through the following sections all the way to the change log and index at the end of this document.

The following sections document the actual implementation of the lwarp package.

line numbers — The small numbers at the left end of a line refer to line numbers in the `lwarp.sty` file.

subjects — Blue-colored tags in the left margin aid in quickly identifying the subject of each paragraph. These are often the targets of index entries.

Prog Lwarp

index entries — Black-colored tags in the left marign are used to identify programming objects such as files, packages, environments, booleans, and counters. Items without a tag are command macros. Each of these also appears in the index as individual entries, and are also listed together under “files”, “packages”, “environments”, “booleans”, and “counters”.

20 Package load order

Several packages must never be used with lwarp, others should only be loaded before lwarp, and others should only be loaded after. The lwarp core checks most

of these cases. In some lwarp-* packages, \LWR@loadbefore is used to trigger an error if they are loaded after lwarp, while additional code provides necessary patches for when they are loaded before.

Packages which must be loaded after lwarp are enfoced by a large number of \LWR@loadafter statements, below. Some packages are emulated by memoir, and so these are tested by \LWR@notmemoirloadafter, which does not cause an error if memoir is used.

\LWR@checkloadfilename is used to check each filename to see if it must never be loaded, or must always be loaded before lwarp.

20.1 Tests of package load order

21 MD5 hashing

The MD5 hash is used for `lateximage` filenames for SVG math.

```
\newcommand{\LWR@mdfive}[1]{%
    \PackageError{lwarp}
        {No MD5 macro was found}
        {%
            Lwarp must find the macros \protect\pdfmdfivesum\space
            or \protect\mdfivesum.%
        }
}
```

The default for PDF LaTeX, DVI LaTeX, upLaTeX, etc:

```
\let\LWR@mdfive\pdfmdfivesum
```

For LuaLaTeX:

```
\ifLuaTeX
\RequirePackage{pdftexcmds}
\let\LWR@mdfive\pdf@mdfivesum
\fi
```

For XeLaTeX:

```
\ifXeTeX
\@ifundefined{pdffivesum}{}
    {\let\LWR@mdfive\pdfmdfivesum}
\@ifundefined{mdfivesum}{}
    {\let\LWR@mdfive\mdfivesum}
\fi
```

22 pdf LaTeX T1 and utf-8 encoding

When using pdf LaTeX, lwarp requires T1 font encoding, and recommends utf-8 input encoding.

If some other input encoding is already defined, lwarp will try to use it instead, and hope for the best.

XeLaTeX and LuaLaTeX are both utf-8 by nature.

`\LWR@pdfencoding` Sets `T1`, and also `utf8` if not already set.

```
\newcommand*{\LWR@pdfencoding}{%
    \RequirePackage[T1]{fontenc}

    \IfPackageLoadedTF{inputenc}{}{
        \IfPackageLoadedTF{inputenx}{}{
            \RequirePackage[utf8]{inputenc}
        }
    }
}
```

```
\ifPDFTeX% pdflatex or dvi latex
    \LWR@pdfencoding
\fi

\ifpTeX
    \LWR@pdfencoding
\fi
```

23 Unicode input characters

for HTML & PRINT: If using *pdflatex*, convert a minimal set of Unicode characters. Additional characters may be defined by the user, as needed.

A commonly-used multiply symbol is declared to be `\texttimes`.

The first arguments of `\newunicodechar` below are text ligatures in the source code, even though they are not printed in the following listing.

```
\ifpTeX
\else
\RequirePackage{newunicodechar}

```

```
\newunicodechar{×}{\texttimes}

\ifPDFTeX% pdflatex or dvi latex
\newunicodechar{ff}{ff}% Here, the first arguments are ligatures.
\newunicodechar{fi}{fi}
\newunicodechar{fl}{fl}
\newunicodechar{ffi}{ffi}
\newunicodechar{ffl}{ffl}
\newunicodechar{–}{---}
\newunicodechar{-}{--}
\fi

\fi
```

24 Avoid a bitmapped font

If DVI or PDF LaTeX, and if the default Computer Modern is the selected font family, ensure that cm-super or lmodern is used to provide a vector font.

```
\ifxetexorluatex
\else
    \ifdefstring{\f@family}{cmr}{
        \IfFileExists{type1ec.sty}% found in cm-super
        {}
        {% cm-super not installed
            \IfFileExists{lmodern.sty}{
               \PackageInfo{lwarp}{cm-super not installed, loading lmodern}
                \RequirePackage{lmodern}
            }{
                \PackageError{lwarp}
                {%
                    Lwarp requires a vector font.\MessageBreak
                 Install and load cm-super, lmodern, or another\MessageBreak
                    Type-1 vector font before loading lwarp.\MessageBreak
                    Enter 'H' for possible solutions%
                }
                {%
                    Install cm-super or lmodern.\MessageBreak
                    If lmodern, load it before lwarp:\MessageBreak
                     \space\space\protect\usepackage{lmodern}\MessageBreak
                        \space\space\protect\usepackage{lwarp}%
                }
            }
        }% cm-super not installed
    }{}% f@family
\fi
```

25 Upright quotes

In PDF TeX, preserve upright quotes in verbatim text. upquote also loads textcomp.

```
\ifPDFTeX
\RequirePackage{upquote}
\fi
```

```
\ifpTeX
    \RequirePackage{upquote}
\fi
```

26 Avoid bad font combinations

For XeLaTeX and LuaLaTeX, certain font combinations cause problems with lwarp.

libertinus-otf has special handling for `\textquotedbl`. Search for `\LWR@orig@textquotedbl`.

```
\ifxetexorluatex
    \AtBeginDocument{
        \IfPackageLoadedTF{kpfonts}{
            \PackageError{lwarp}
                {%
                    When using XeLaTeX or LuaLaTeX,\MessageBreak
                    use kpfonts-otf instead of kpfonts%
                }
                {%
                    Replace: \protect\usepackage{kpfonts}\MessageBreak
                    with: \protect\usepackage{kpfonts-otf}
                }
        }{}
    }
\fi
```

27 Miscellaneous tools

27.1 Variables

```
\newlength{\LWR@templengthone}
\newlength{\LWR@templengthtwo}
\newlength{\LWR@templengththree}
\newcounter{LWR@tempcountone}
```

27.2 Lengths and units

`\LWR@providelength` {⟨\lengthname⟩} Provides the length if it isn't defined yet.

Used to provide source compatibility for lengths which will be ignored, but might or might not be already provided by other packages.

```
\newcommand*\LWR@providelength[1]{%
    \ifdeflength{#1}{}{\newlength{#1}}%
}
```

`\LWR@convertto` {⟨*dest unit*⟩} {⟨*length*⟩}

Prints a length in the given units, without printing the unit itself.

```
\newcommand*{\LWR@convertto}[2]{\strip@pt\dimexpr #2*65536/\number\dimexpr 1#1}
```

\LWR@printpercentlength {⟨*smaller*⟩} {⟨*larger*⟩}

Prints a percent ratio of the two lengths.

```
\newcommand*{\LWR@printpercentlength}[2]{%
    \setcounter{LWR@tempcountone}{100*\ratio{#1}{#2}}%
    \arabic{LWR@tempcountone}%
}
```

27.3 Counters

\defaddtocounter {⟨*name*⟩} {⟨*value*⟩}

Locally add to a counter.

```
\providecommand*{\defaddtocounter}[2]{%
    \defcounter{#1}{\value{#1}+#2}%
}
```

27.4 Patching macros

\LWR@patcherror {⟨*packagename*⟩} {⟨*macroname*⟩}

Prints an error if could not patch a macro.

```
\newcommand*{\LWR@patcherror}[2]{%
    \PackageError{lwarp}%
        {%
            Unable to patch package #1,\MessageBreak
            macro \LWRbackslash #2.\MessageBreak
            Lwarp or #1 may need to be updated%
        }%
        {Please contact the maintainer of the Lwarp package.}%
}
```

27.5 Copying macros

\csNewCommandCopycs {⟨*dest csname*⟩} {⟨*source csname*⟩}

Given a cs-name for each, copies a macro to a new definition.

```
\providecommand*{\csNewCommandCopycs}[2]{%
    \expandafter\NewCommandCopy\csname#1\expandafter\endcsname%
        \csname#2\endcsname%
}
```

\NewEnvironmentCopy {⟨*dest*⟩} {⟨*source*⟩}

Copies an environment to a new definition.

```
\providecommand*{\NewEnvironmentCopy}[2]{%
    \csNewCommandCopycs{#1}{#2}%
    \csNewCommandCopycs{end#1}{end#2}%
}
```

27.6 Chinese text isolation

\LWR@isolate {⟨*text*⟩} Isolates Chinese characters from the surrounding text. This is required to avoid extra spaces on either side of the Chinese characters, especially when written to a file.

```
\newcommand{\LWR@isolate}[1]{#1}%

\IfPackageLoadedTF{ctexpatch}{
    \renewcommand{\LWR@isolate}[1]{\null#1\null}%
}{}

\IfPackageLoadedTF{xeCJK}{
    \renewcommand{\LWR@isolate}[1]{\null#1\null}%
}{}
```

\LWR@disablepinyin Disable xpinyin during file, sideTOC, and footnote generation. Set by xpinyin.

```
\newcommand*{\LWR@disablepinyin}{}
```

27.7 Inserting vertical space

\LWR@forceemptyline Extra vertical space in the HTML output. Use after \LWR@stoppars.

```
\newcommand*{\LWR@forceemptyline}{%
    \LWR@origrule{0pt}{1\baselineskip}%
    \LWR@orignewline%
}
```

27.8 Argument selection

\LWR@thirdofthree {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩}

\LWR@fourthoffour {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩}

\LWR@firstoffive {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩} {⟨*fifth*⟩}

\LWR@secondoffive {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩} {⟨*fifth*⟩}

\LWR@thirdoffive {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩} {⟨*fifth*⟩}

\LWR@fourthoffive {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩} {⟨*fifth*⟩}

\LWR@fifthoffive {⟨*first*⟩} {⟨*second*⟩} {⟨*third*⟩} {⟨*fourth*⟩} {⟨*fifth*⟩}

Expands to the nth of the five arguments. Used for extra cross referencing.

```
\long\def\LWR@thirdofthree#1#2#3{#3}%
\long\def\LWR@fourthoffour#1#2#3#4{#4}%

```

```

27.9 Inside boxes

Greater than zero if currently inside a TEX box, thus should not use \LWR@orignewpage. See section 13.2.

```
\newcounter{LWR@texboxdepth}
\setcounter{LWR@texboxdepth}{0}
```

\LWR@maybe@orignewpage Only do \LWR@orignewpage if not inside a TEX box.

27.12 Title case

\LWRtexttitlecase

```
\ExplSyntaxOn
\newcommand*{\LWRtexttitlecase}[1]{%
    \text_titlecase:n{#1}%
}
\ExplSyntaxOff
```

27.13 LetLtxMacrocs

\LWR@LetLtxMacrocs {⟨*newcsname*⟩} {⟨*oldcsname*⟩}

\LetLtxMacro with cs names.

```
\newcommand*{\LWR@LetLtxMacrocs}[2]{%
    \expandafter\LetLtxMacro\csname #1\expandafter\endcsname%
    \csname#2\endcsname%

```

27.14 Absorbing a star

\LWR@absorbstar {⟨*csname*⟩}

Modifies a macro to aborb a star. Used for cleveref, since hyperref is emulated, so the starred macros are not created by cleveref.

```
\newcommand*{\LWR@absorbstar}[1]{%
    \LWR@LetLtxMacrocs{LWR@origns@#1}{#1}%
    \csdef{#1}{\@ifstar{\csuse{LWR@origns@#1}}{\csuse{LWR@origns@#1}}}
    \expandafter\robustify\csname #1\endcsname
}
```

28 Operating-System portability

Prog Unix
Prog Mac OS
Prog Linux
Prog MS-Windows
Prog Windows
Opt OSWindows

lwarp tries to detect which operating system is being used. UNIX / MAC OS / LINUX is the default (collectively referred to as "UNIX" in the configuration files), and MS-WINDOWS is supported as well.

If MS-WINDOWS is not correctly detected, use the lwarp option `OSWindows`.

When detected or specified, the operating-system path separator used by lwarp is modified, and the boolean `usingOSWindows` is set `true`. This boolean may be tested by the user for later use.

28.1 Literal characters

Literal characters to be used in `PrintLatexCmd` and `HTMLLatexCmd`. These are defined without `@` to easily allow their inclusion in the user's document.

The literal `%` character:

```
\let\LWRpercent\@percentchar
```

The literal `$` character:

```
\catcode`\$=12
\def\LWRdollar{$}
\catcode`\$=3
```

The literal `&` character:

```
\catcode`\&=12
\def\LWRamp{&}
\catcode`\&=4
```

The literal `\` character. The ampersand is temporarily set to the escape character during the definition of the backslash macro.

```
\catcode`\&=0
&catcode`&\=12
&def&LWRbackslash{\}
&catcode`&\=0
\catcode`\&=4
```

The literal `{` character. The ampersand is temporarily set to the begin group character during the definition of the leftbrace macro.

```
\catcode`\&=1
\catcode`\{=12
\def\LWRleftbrace&{}
```

```
\catcode`\{=1
\catcode`\&=4
```

The literal } character. The ampersand is temporarily set to the end group character during the definition of the leftbrace macro.

```
\catcode`\&=2
\catcode`\}=12
\def\LWRrightbrace{}&
\catcode`\}=2
\catcode`\&=4
```

The literal # character:

```
\catcode`\#=12
\def\LWRhash{#}
\catcode`\#=6
```

`\LWRopquote` The operating system's quote mark, UNIX default. For WINDOWS, see `\LWR@setOSWindows`, below.

```
\def\LWRopquote{'}
```

`\LWRopseq` The operating system's sequential execution command, UNIX default. For WINDOWS, see `\LWR@setOSWindows`, below.

```
\def\LWRopseq{\space\LWRamp\LWRamp\space\space}
```

28.2 Common portability code

Bool `usingOSWindows` Set if the `OSWindows` option is used, or if WINDOWS is automatically detected.

```
\newbool{usingOSWindows}
\boolfalse{usingOSWindows}
```

28.3 UNIX, LINUX, and MAC OS

`\OSPathSymbol` Symbol used to separate directories in a path.

```
\newcommand*{\OSPathSymbol}{/}
```

28.4 MS-WINDOWS

For MS-WINDOWS:

`\LWR@setOSWindows` Set defaults for the MS-WINDOWS operating system. lwarp attempts to auto-detect the operatings system, and the `OSWindows` option may also be used to force MS-WINDOWS compatibility.

```
\newcommand*{\LWR@setOSWindows}
```

```
{
\booltrue{usingOSWindows}
\renewcommand*{\OSPathSymbol}{\@backslashchar}
\def\LWRopquote{"}
\def\LWRopseq{\space\LWRamp\space\space}
}
```

Test for windows during compile. The user may also specify `OSWindows` package option in case this test fails.

```
\ifwindows
\LWR@setOSWindows
\fi
```

29 Package options

Pkg `kvoptions` Allows key/value package options.

```
\RequirePackage{kvoptions}
\SetupKeyvalOptions{family=LWR,prefix=LWR@}
```

`\lwarpsetup` A user interface to set the keys:

```
\newcommand{\lwarpsetup}[1]{\setkeys{LWR}{#1}}
```

Bool `warpingprint`
Bool `warpingHTML`
Bool `mathjax`
Bool `LWR@origmathjax`

Set to true/false depending on the package option selections for print/HTML/EPUB output and mathsvg/mathjax.

`LWR@origmathjax` remembers the original setting to be restored by `\displaymathnormal`.

```
\newbool{warpingprint}
\newbool{warpingHTML}
\newbool{mathjax}
\newbool{LWR@origmathjax}
```

defaults The default is print output, and SVG math if the user chose HTML output.

```
\booltrue{warpingprint}%
\boolfalse{warpingHTML}%
\boolfalse{mathjax}%
```

Opt `warpprint` If the `warpprint` option is given, boolean `warpingprint` is true and boolean `warpingHTML` is false, and may be used for `\ifbool` tests.

```
\DeclareVoidOption{warpprint}{%
    \PackageInfo{lwarp}{Using option 'warpprint'}
    \booltrue{warpingprint}%
    \boolfalse{warpingHTML}%
}
```

Opt `warpHTML` Anything in the `warpHTML` environment will be generated for HTML output only.

Opt warpHTML

If the warpHTML option is given, boolean warpingHTML is true and boolean warpingprint is false, and may be used for \ifbool tests.

```
\DeclareVoidOption{warpHTML}{%
    \PackageInfo{lwarp}{Using option 'warpHTML'}%
    \booltrue{warpingHTML}%
    \boolfalse{warpingprint}%
}
```

Opt mathsvg

Option mathsvg selects SVG math display: If the mathsvg option is given, boolean mathjax is false, and may be used for \ifbool tests.

```
\DeclareVoidOption{mathsvg}{%
    \PackageInfo{lwarp}{Using option 'mathsvg'}
    \boolfalse{mathjax}%
    \boolfalse{LWR@origmathjax}%

}
```

Opt mathjax

Option mathjax selects MathJax math display: If the mathjax option is given, boolean mathjax is true, may be used for \ifbool tests.

```
\DeclareVoidOption{mathjax}{%
    \PackageInfo{lwarp}{Using option 'mathjax'}
    \booltrue{mathjax}%
    \booltrue{LWR@origmathjax}%

}
```

Opt BaseJobname
Default: \jobname

Option BaseJobname sets the \BaseJobname for this document.

This is the \jobname of the printed version, even if currently compiling the HTML version. I.e. this is the \jobname without _html appended. This is used to set \HomeHTMLFilename if the user did not provide one.

```
\DeclareStringOption[\jobname]{BaseJobname}
```

Opt ImagesDirectory
Default: \jobname-images

Option ImagesDirectory sets the name of the directory to use for the lateximage images.

```
\DeclareStringOption[\BaseJobname-images]{ImagesDirectory}
```

Opt ImagesName
Default: image-

Option ImagesName sets the prefix to use for the lateximage images.

```
\DeclareStringOption[image-]{ImagesName}
```

Opt makeindexStyle
Default: lwarp.ist

Selects a custom .ist file. A customized file should be based on lwarp.ist. See section 8.6.20.

```
\DeclareStringOption[lwarp.ist]{makeindexStyle}
```

Opt xindyStyle
Default: lwarp.xdy

Selects a custom .xdy file. A customized file should be based on lwarp.xdy. See section 8.6.21.

```
\DeclareStringOption[lwarp.xdy]{xindyStyle}
```

Opt `xindyLanguage`
Default: `english`

Sets the *xindy* language to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index and glossary.

```
\DeclareStringOption[english]{xindyLanguage}
```

Opt `xindyCodepage`
Default: `utf8`

Sets the *xindy* codepage to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index.

```
\DeclareStringOption[utf8]{xindyCodepage}
```

Opt `xindexConfig`
Default: `<empty>`

Selects a custom `xindex-*.lua` file. A customized file should be based on `xindex-cfg.lua`. See section 8.6.22.

```
\DeclareStringOption[]{xindexConfig}
```

Opt `pdftotextEnc`
Default: `UTF-8`

The option `pdftotextEnc` sets the encoding used by *pdftotext*. This is passed to *pdftotext* using its `-enc` option, and is used when converting LaTeX PDF output with HTML tags into a plain-text file with HTML tags.

```
\DeclareStringOption[UTF-8]{pdftotextEnc}
```

Opt `lwarpmk`

Tells lwarp to generate a local copy of *lwarpmk* called `lwarpmk.lua`. Useful for archiving for future use. This file may be made executable and acts just like *lwarpmk*.

If `lwarpmk` option, creates a local copy of `lwarpmk.lua`:

```
\newbool{LWR@creatinglwarpmk}
\boolfalse{LWR@creatinglwarpmk}

\DeclareVoidOption{lwarpmk}{
    \PackageInfo{lwarp}{Using option 'lwarpmk'}
    \booltrue{LWR@creatinglwarpmk}
}
```

Opt `OSWindows`

Tells lwarp to use MS-Windows compatibility. Auto-detection of the operating system is attempted, and this option is only necessary if the auto-detection fails. See the automatically-generated `lwarpmk.conf` file to find out whether the operating system was detected correctly.

```
\DeclareVoidOption{OSWindows}{
    \PackageInfo{lwarp}{Using option 'OSWindows'}
    \LWR@setOSWindows
}
```

Opt `HomeHTMLFilename`
Default: `\BaseJobname`

The filename of the homepage. The default is the jobname. This option is stored into `\LWR@HomeHTMLFilename`, and later transferred into `\HomeHTMLFilename` for internal use.

```
\DeclareStringOption[]{HomeHTMLFilename}
```

Opt `HTMLFilename`
Default: `<empty>`

The filename prefix of web pages after the homepage. The default is empty, no prefix. This option is stored into `\LWR@HTMLFilename`, and later transferred into `\HTMLFilename` for internal use.

```
\DeclareStringOption[]{HTMLFilename}
```

Opt `PrintLatexCmd`
Default: `<automatic>`

The shell commands to use to compile the print document.

```
\DeclareStringOption[]{PrintLatexCmd}
```

Opt `HTMLLatexCmd`
Default: `<automatic>`

The shell commands to use to compile the HTML document.

```
\DeclareStringOption[]{HTMLLatexCmd}
```

Opt `PrintIndexCmd`
Default: `<empty>`

The shell commands to use to compile the print indexes.

```
\DeclareStringOption[]{PrintIndexCmd}
```

Opt `HTMLIndexCmd`
Default: `<empty>`

The shell commands to use to compile the HTML indexes.

```
\DeclareStringOption[]{HTMLIndexCmd}
```

Opt `LatexmkIndexCmd`
Default: `<empty>`

The shell commands to by used by *latexmk* to compile the print indexes. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include the filename, which will be provided by *latexmk*.

```
\DeclareStringOption[]{LatexmkIndexCmd}
```

Opt `makeindex`

Tells lwarp to use *makeindex* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *makeindex* with a single index file.

```
\DeclareBoolOption[false]{makeindex}
```

Opt `xindy`

Tells lwarp to use *xindy* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *xindy* with a single index file.

```
\DeclareBoolOption[false]{xindy}
```

Opt `xindex`

Tells lwarp to use *xindex* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *xindex* with a single index file.

```
\DeclareBoolOption[false]{xindex}
```

Opt `IndexRef`
Default: `cref`

Tells lwarp how to display the index entries in HTMLoutput. See section 7.5.

```
\DeclareStringOption[cref]{IndexRef}
```

Opt `GlossaryCmd`
Default: `makeglossaries`

The shell command to use to compile the glossary. The print or HTML version of the glossary filename will be appended to this command.

```
\DeclareStringOption[makeglossaries]{GlossaryCmd}
```

Opt `latexmk`

Option `latexmk` tells *lwarpmk* to use *latexmk* when compiling documents.

```
\DeclareBoolOption[false]{latexmk}
```

Opt dvips

Option dvips tells *lwarpmk* to use *dvips* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvips}
```

Opt dvipdfm

Option dvipdfm tells *lwarpmk* to use *dvipdfm* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvipdfm}
```

Opt dvipdfmx

Option dvipdfmx tells *lwarpmk* to use *dvipdfmx* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvipdfmx}
```

Execute options

Execute the package options, with the defaults which have been set just above:

```
\ProcessKeyvalOptions*\relax
```

29.1 Additional options support

Assign the \BaseJobname if the user hasn't provided one:

```
\providecommand*{\BaseJobname}{\LWR@BaseJobname}
```

Defaults unless already over-ridden by the user:

```
\ifcsempty{LWR@HomeHTMLFilename}{
    \newcommand*{\HomeHTMLFilename}{\BaseJobname}
}{
    \csedef{HomeHTMLFilename}{\LWR@HomeHTMLFilename}
}

\csedef{HTMLFilename}{\LWR@HTMLFilename}
```

Special handling for underscores in labels and filenames.

\LWR@sanitized

The sanitized version of what was given to \LWR@sanitize. Characters are set to their detokenized versions. Required for underscores in labels and filenames.

```
\newcommand*{\LWR@sanitized}{}
```

\LWR@sanitize {⟨*text*⟩}

Sanitizes the text and returns the result in \LWR@sanitized.

```
\newcommand*{\LWR@sanitize}[1]{%
\edef\LWR@sanitized{#1}%
\edef\LWR@sanitized{\detokenize\expandafter{\LWR@sanitized}}%
}
```

Sanitize some string options to neutralize underscores.

```
\LWR@sanitize{\LWR@BaseJobname}
\edef\LWR@BaseJobname{\LWR@sanitized}
```

```
\LWR@sanitize{\LWR@ImagesDirectory}
\edef\LWR@ImagesDirectory{\LWR@sanitized}

\LWR@sanitize{\LWR@ImagesName}
\edef\LWR@ImagesName{\LWR@sanitized}
```

`\LWR@PrintIndexCmd` and `\LWR@HTMLIndexCmd` are tested to see if they are empty. If so, they are set to a reasonable defaults for a single index using *makeindex*, then possibly set to defaults for *xindy* if the lwarp `xindy` option was selected, then likewise for *xindex* if the `xindex` option was selected.

30 Required packages

These packages are automatically loaded by lwarp when generating HTML output. Some of them are also automatically loaded when generating print output, but some are not.

for HTML output:

```
\begin{warpHTML}
```

Pkg fontspec Load fontspec if necessary:

```
\ifxetexorluatex
\IfPackageLoadedTF{fontspec}{}{
    \usepackage[no-math]{fontspec}
}
```

The monospaced font is used for HTML tags, so turn off its TeX ligatures and common ligatures:

```
\defaultfontfeatures[\rmfamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\sffamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\ttfamily]{Ligatures=NoCommon}
\else
```

pdflatex only: Only pre-loaded if *pdflatex* is being used.

Pkg microtype

ligatures Older browsers don't display ligatures. Turn off letter ligatures, keeping LaTeX dash and quote ligatures, which may fail on older browers but at least won't corrupt written words.

```
\RequirePackage{microtype}

\microtypesetup{
    protrusion=false,
    expansion=false,
    tracking=false,
    kerning=false,
    spacing=false}
%    \begin{macrocode}
%
% Disable ligatures for typewriter fonts.
% The comma was causing issues with \MathJax\ and \cs{,} followed by a comma.
% Ligatures for f, q, t, etc used to be disabled for non-typewriter fonts, but
% are now allowed.
% \changes{v0.89}{2020/08/01}{Disable typewriter ligatures.}
% ^^A \DisableLigatures[{,},f,q,t,T,Q]{encoding = *,family = *}% previous
%    \begin{macrocode}
\DisableLigatures{encoding = *,family = tt*}

\fi

\end{warpHTML}
```

Pkg geometry Tactics to avoid unwanted page breaks and margin overflow:

- Uses a very long and wide page to minimize page breaks and margin overflow.
- Uses a scriptsize font.
- Uses extra space at the margin to avoid HTML tag overflow off the page.
- Forces a new PDF page before some environments.
- Forces line break between major pieces of long tags.

for HTML output:

```
\begin{warpHTML}
```

If geometry has not yet been loaded, use the preexising page and text sizes to be preserved for later reuse. These will be replaced by lwarp `\AtBeginDocument` with a very large page size to reduce HTML tag overflow off the page.

```
\IfPackageLoadedTF{geometry}
{}{
    \RequirePackage[
```

```
        reset,
        paperwidth=\paperwidth,
        paperheight=\paperheight,

        marginparwidth=\marginparwidth,
    ]{geometry}
}
```

Remember the original definitions for later reuse. If the geometry package is loaded by the user, lwarp-geometry will nullify the user-level originals.

```
\LetLtxMacro\LWR@origgeometry\geometry
\LetLtxMacro\LWR@orignewgeometry\newgeometry
\LetLtxMacro\LWR@origrestoregeometry\restoregeometry
\LetLtxMacro\LWR@origsavegeometry\savegeometry
\LetLtxMacro\LWR@origloadgeometry\loadgeometry
```

Bool
LWR@allowanothergeometry

geometry may be loaded by the user before lwarp, after lwarp, or not at all. If before lwarp, it will have already been loaded by now and its page layout has already been saved. If geometry is loaded after lwarp, its layout will be set at that time and the user macros nullified. \AtEndPreamble this layout will be saved. If the user never loads geometry, lwarp-geometry will be loaded \AtBeginDocument, but it should not change the page layout set here. This is controlled by the boolean LWR@allowanothergeometry. Geometry may be adjusted throughout the preamble until \AtEndPreamble, when this boolean is set false.

```
\newbool{LWR@allowanothergeometry}
\booltrue{LWR@allowanothergeometry}
```

Use \AtEndPreamble to avoid class and option conflict by changing settings after other packages load, instead of using geometry package options:

```
\AtEndPreamble{
```

Whatever geometry choices the user has made in the preamble, either before or after lwarp was loaded, are now saved for possible temporary reuse, such as by lyluatex.

See the lwarp-geometry section for what happens if geometry is loaded after lwarp.

```
\LWR@origsavegeometry{LWR@usergeometry}
```

The user's paper size is saved for later reuse, such as by the pdfpages or parallel packages.

```
\newlength{\LWR@userspaperwidth}
\setlength{\LWR@userspaperwidth}{\paperwidth}

\newlength{\LWR@userspaperheight}
\setlength{\LWR@userspaperheight}{\paperheight}

\newlength{\LWR@usersmarginparwidth}
\setlength{\LWR@usersmarginparwidth}{\marginparwidth}

```

```
\newlength{\LWR@userstextwidth}
\setlength{\LWR@userstextwidth}{\textwidth}

\newlength{\LWR@userstextheight}
\setlength{\LWR@userstextwidth}{\textheight}
```

For lwarp, use a very large page and margins to help avoid letting HTML tags run off the edge:

```
\LWR@origgeometry{
    reset,
    paperheight=190in,
    paperwidth=20in,
    left=2in,
    right=6in,
    top=1in,
    bottom=1in,
    heightrounded,%
}
```

The lwarp page geometry is saved for future restore:

```
\LWR@origsavegeometry{LWR@lwarpgeometry}
```

No longer adjust the page layout when lwarp-geometry is loaded `\AtBeginDocument`:

```
\boolfalse{LWR@allowanothergeometry}%
```

ltjsbook and other classes can print vertically, and require these to be reset by lwarp:

```
\setlength{\textheight}{0.8\paperheight}
\setlength{\textwidth}{0.7\paperwidth}

\@twosidefalse
\@mparswitchfalse
}% \AtEndPreamble

Pkg filecontents

Used to write helper files while creating the print version.

Recent versions of LaTeX (as of Fall 2019) now include the functionality of the filecontents package, but with a new optional argument used to specify whether to force the overwriting of an existing file. If an older LaTeX kernel is used, the original filecontents package is used, but it is patched to throw away the new optional argument.

```

31 Loading packages

\RequirePackage and \usepackage are modified to error-check for certain packages, and for HTML they load the lwarp- version if it exists.

3. `<filename>_html_inc.aux` is automatically generated and used by LaTeX.

36 Defining print and HTML versions of macros and environments

The following refers to defining objects inside lwarp, and may also be of some use for package authors to adapt their packages for lwarp. The following is not for the user's document.

Many macros and environments must be provided as both print and HTML versions.

While generating the print version of a document, the original macros as defined by LaTeX and its packages are used as-is.

While generating the HTML version of a document, the original macro or environment is redefined to call a new HTML version or a copy of the original print

version. The new HTML versions of macros and environments are used most of the time. Copies of the print versions are used inside a `latexmage` environment, which draws and remembers an image of the printed output, and also several other places.

The general structure for providing print and HTML versions of a macro or environment is as follows:

For a preexisting macro: An HTML version is provided with a special name, inside a `warpHTML` environment, then `\LWR@formatted` is used to redefine and patch various macros:

```
\begin{warpHTML}
\newcommand{\LWR@HTML@name}{...}

\LWR@formatted{name}
\end{warpHTML}
```

`\LWR@formatted{name}` copies the original print version to a new name `\LWR@print@<name>`, then redefines `\name` to use either the print or HTML version depending on which mode lwarp is using.

For a preexisiting environment: The process is similar. Note the use of `\LWR@formattedenv` instead of `\LWR@formatted`.

```
\begin{warpHTML}
\newenvironment{LWR@HTML@name}{...}{..}

\LWR@formattedenv{name}
\end{warpHTML}
```

For a new macro or environment: The print version is defined inside `warpall`, so that it can also be seen and modified by during HTML outut.

```
\begin{warpall}
\newcommand{\name}{...}% The print version.
\end{warpall}

\begin{warpHTML}
\newcommand{\LWR@HTML@name}{...}

\LWR@formatted{name}
\end{warpHTML}
```

Similar for an environment, using `\formattedenv`.

In general, `\LWR@formatted` or `\LWR@formattedenv` are placed inside a `warpHTML` environment, and while producing an HTML document they do the following:

- Macros are modified:
  1. The pre-existing print version `\name` is saved as `\LWR@print@<name>`, unless `\LWR@print@<name>` is already defined.
  2. The original `\name` is redefined to call either the print or HTML version depending on which format is in use at the moment, as set by `\LWR@formatting`, which is defined as either "`print`" or "`HTML`".

- When lwarp is producing a print document, the original definitions are used, as well as any new definitions defined in `warpall` above.
- When lwarp is generating HTML output, `\LWR@formatting` is set to "`HTML`", and `\name` is directed to `\LWR@HTML@<name>`. For an environment, `\endname` is directed to `\endLWR@HTML@<name>`.
- When lwarp is generating HTML output but enters a `lateximage` environment, or for some other reason needs to draw images using the original print defintions, `\LWR@formatting` is changed to "`print`" and `\name` is then redirected to `\LWR@print@<name>`, which was the original `\name`.
- Since the new `\name` does not process any arguments, they are processed by `\LWR@print@name` or `\LWR@HTML@name`.

Expandable versions are also provided as well. These usually are necessary for anything which could appear inside a `tabular`, without which a "`Misplaced \omit`" error may occur.

⚠ Misplaced `\omit` error

```
\LWR@expandableformatted
\LWR@expandableformattedenv
```

(Older versions of lwarp used `\LetLtxMacro` for everything, but this could fail when using macros defined by xparse. This older system is still in use for many definitions.)

for HTML output:

```
\begin{warpHTML}
```

`\LWR@formatting` Remembers if selected print/HTML formatting.

Used while `\LWR@restoreorigformatting`, such as in an `lateximage`. May be set to either "`print`" or "`HTML`".

37 HTML-conversion output modifications

These booleans modify the HTML output in various ways to improve conversion to EPUB or word processor imports.

for HTML & PRINT:

```
\begin{warpall}
```

37.1 User-level controls

Bool `FormatEPUB` Default: `false`

Changes HTML output for easy EPUB conversion via an external program. Removes per-file headers, footers, and nav. Adds footnotes per chapter/section.

```
\newbool{FormatEPUB}
\boolfalse{FormatEPUB}
```

Bool `FormatWP` Default: `false`

Changes HTML output for easier conversion by a word processor. Removes headers and nav, prints footnotes per section, and also forces single-file output and turns off HTML debug comments.

```
\newbool{FormatWP}
\boolfalse{FormatWP}
```

Bool `WPMarkFloats` Default: `false`

Adds

```
=== begin table ===
. . .
=== end ===
```

or

```
=== begin figure ===
. . .
=== end ===
```

around floats while formatting for word processors. This helps identify boundaries of floats to be manually converted to word-processor frames and captions. [18]

```
\newbool{WPMarkFloats}
\boolfalse{WPMarkFloats}
```

Bool `WPMarkMinipages` Default: `false`

Adds

```
=== begin minipage ===
. . .
=== end minipage ===
```

around minipages while formatting for word processors. This helps identify boundaries of minipages to be manually converted to word-processor frames.

```
\newbool{WPMarkMinipages}
\boolfalse{WPMarkMinipages}
```

[18] Perhaps some day word processors will have HTML import options for identifying `<figure>` and caption tags for figures and tables.

Bool WPMarkTOC
Default: true

While formatting for word processors, adds

```
=== table of contents ===
```

where the Table of Contents would have been. This helps identify where to insert the actual TOC.

If set false*, the actual toc is printed instead.*

```
\newbool{WPMarkTOC}
\booltrue{WPMarkTOC}
```

Bool WPMarkLOFT
Default: false

While formatting for word processors, adds

```
=== list of figures ===    and/or
=== list of tables ===
```

where each of these lists would have been. This helps identify where to insert the actual lists.

If set false*, the actual lists are printed instead.*

```
\newbool{WPMarkLOFT}
\boolfalse{WPMarkLOFT}
```

Bool WPMarkMath
Default: false

While formatting for word processors, prints math as LaTeX code instead of creating SVG images or MathJax. This is useful for cut/paste into the *LibreOffice Writer TeXMaths* extension.

```
\newbool{WPMarkMath}
\boolfalse{WPMarkMath}
```

Bool WPTitleHeading
Default: false

While formatting for word processors, true sets the document title to <h1>, which is expected for HTML documents, but also causes the lower-level section headings to start at **Heading 2** when imported into LibreOffice. Set to false to cause the title to be plain text, and the section headings to begin at **Heading 1**.

See table 11 on page 183.

```
\newbool{WPTitleHeading}
\boolfalse{WPTitleHeading}
```

```
\end{warpall}
```

37.2 Heading adjustments

If formatting the HTML for a word processor, adjust heading levels.

If WPTitleHeading is true, adjust so that part is **Heading 1**.

If WPTitleHeading is false, use <h1> for the title, and set part to **Heading 2**.

38 Remembering original formatting macros

for HTML output:

```

Remember original definitions of formatting commands. Will be changed to HTML commands for most uses. Will be temporarily restored to original meaning inside any latexmage environment. Also nullify unused commands.

Some packages redefine \#, which is used to generate HTML, so the original must be remembered here.

39 Accents

Native LaTeX accents such as \" will work, but many more kinds of accents are available when using Unicode-aware XeLaTeX and LuaLaTeX. If using accents in section names which will become file names, it is recommended to use the LaTeX accents such as \" and \v instead of Unicode accents. The LaTeX accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

for HTML output:

```
\begin{warpHTML}
```

Without \AtBeginDocument, \t was being re-defined somewhere.

```
\AtBeginDocument{
```

The following are restored for print when inside a `lateximage`.

For Unicode engines, only `\t` needs to be redefined:

```
\LetLtxMacro\LWR@origtie\t
```

For PDF LaTeX, additional work is required:

```
\ifPDFTeX% pdflatex or dvi latex
\LetLtxMacro\LWR@origgraveaccent\‘
\LetLtxMacro\LWR@origacuteaccent\’
\LetLtxMacro\LWR@origcircumflexaccent\^
\LetLtxMacro\LWR@origtildeaccent\~
\LetLtxMacro\LWR@origmacronaccent\=
\LetLtxMacro\LWR@origbreve\u
\LetLtxMacro\LWR@origdotaccent\.
\LetLtxMacro\LWR@origdiaeresisaccent\"
\LetLtxMacro\LWR@origdoubleacuteaccent\H
\LetLtxMacro\LWR@origcaronaccent\v
\LetLtxMacro\LWR@origdotbelowaccent\d
\LetLtxMacro\LWR@origcedillaaccent\c
\LetLtxMacro\LWR@origmacronbelowaccent\b
```

The HTML redefinitions follow.

For PDF LaTeX, Unicode diacritical marks are used:

```
\renewcommand*{\‘}[1]{#1\HTMLunicode{0300}}
\renewcommand*{\’}[1]{#1\HTMLunicode{0301}}
\renewcommand*{\^}[1]{#1\HTMLunicode{0302}}
\renewcommand*{\~}[1]{#1\HTMLunicode{0303}}
\renewcommand*{\=}[1]{#1\HTMLunicode{0304}}
\renewcommand*{\u}[1]{#1\HTMLunicode{0306}}
\renewcommand*{\.}[1]{#1\HTMLunicode{0307}}
\renewcommand*{\"}[1]{#1\HTMLunicode{0308}}
\renewcommand*{\H}[1]{#1\HTMLunicode{030B}}
\renewcommand*{\v}[1]{#1\HTMLunicode{030C}}
\renewcommand*{\d}[1]{#1\HTMLunicode{0323}}
\renewcommand*{\c}[1]{#1\HTMLunicode{0327}}
\renewcommand*{\b}[1]{#1\HTMLunicode{0331}}
\fi
```

For all engines, a Unicode diacritical tie is used:

```
\def\LWR@t#1#2{#1\HTMLunicode{0361}#2}
\renewcommand*{\t}[1]{\LWR@t#1}
```

`\LWR@restoreorigaccents` Called from `\restoreoriginalformatting` when a `lateximage` is begun.

```
\ifPDFTeX% pdflatex or dvi latex
\newcommand*{\LWR@restoreorigaccents}{%

40 Configuration files

40.1 Decide whether to generate configuration files

Configuration files are only written if processing the print version of the document, and not processing a pstool image. pstool uses an additional compile for each image using the original document's preamble, which includes lwarp, so the lwarp configuration files are turned off if `-pstool` is part of the `\jobname`.

Default to no configuration files:

```
\LWR@excludecomment{LWRwriteconf}{writeconf}
```

Generate configuration files if print mode and not `-pstool`:

for PRINT output:

```
\begin{warpprint}
\fullexpandarg%
\IfSubStr*{\jobname}{-pstool}
    {
        \PackageInfo{lwarp}{%
            Jobname with -pstool is found.\MessageBreak
            Not generating lwarp configuration files,%
        }
    }
    {
        \PackageInfo{lwarp}{Generating lwarp configuration files,}%
        \LWR@includecomment{LWRwriteconf}{writeconf}
    }
\end{warpprint}
```

40.2 <project>_html.tex

File `*_html.tex`

Used to allow an HTML version of the document to exist alongside the print version.

Config file:

```
\begin{LWRwriteconf}
\immediate\openout\LWR@quickfile=\jobname_html.tex
\immediate\write\LWR@quickfile{%
\detokenize{\PassOptionsToPackage}%
```

```
{warpHTML,BaseJobname=\jobname}{lwarp}%
}
\immediate\write\LWR@quickfile{%
\detokenize{\input}\string{\jobname.tex\string }%
}
\immediate\closeout\LWR@quickfile
\end{LWRwriteconf}
```

40.3 *lwarpmk* configuration files

Config file:
```
\begin{LWRwriteconf}
```

`\LWR@lwarpconfversion` The version number of the configuration file, allowing *lwarpmk* to detect an obsolete configuration file format. Incremented by one each time the configuration file format changes. (This is NOT the same as the lwarp version number.)

```
\newcommand*{\LWR@lwarpconfversion}{2}% also in lwarpmk.lua
```

40.3.1 Helper macros

`\LWR@shellescapecmd` The LaTeX compile option for shell escape, if used.

```
\ifshellescape
    \def\LWR@shellescapecmd{--shell-escape }
\else
    \def\LWR@shellescapecmd{}
\fi
```

`\LWR@compilecmd` {⟨*engine*⟩} {⟨*suffix*⟩}

Used to form the basic compilation command for a document, adding the optional shell escape.

Engine is *pdflatex*, etc. Suffix is empty or `_html`

```
\newcommand*{\LWR@compilecmd}[2]{%
    #1 \LWR@shellescapecmd \jobname#2%
}
```

`\LWR@addcompilecmd` {⟨*cmd*⟩} {⟨*suffix*⟩}

Adds to the compilation command.

Cmd is *dvipdfmx*, etc. Suffix is empty or `_html`

```
\newcommand*{\LWR@addcompilecmd}[2]{%
    \LWRopseq
    #1 \jobname#2%
}
```

`\LWR@unknownengine` Error message if not sure which LaTeX engine is being used.

```
\newcommand*{\LWR@unknownengine}{%
```

```
    \PackageError{lwarp}%
        {Unknown LaTeX engine}%
        {%
            Lwarp only knows about pdflatex, DVI latex,
            xelatex, lualatex, and upLateX.%
        }%
}
```

`\LWR@latexmkvar` {⟨*varname*⟩} {⟨*value*⟩}

Adds a *latexmk* variable assignment.

```
\newcommand*{\LWR@latexmkvar}[2]{%
    -e
    \LWRopquote%
    \LWRdollar #1=q/#2/%
    \LWRopquote
}
```

`\LWR@latexmkcmd` {⟨*latexmk options*⟩}

Sets a call to *latexmk* with the given options, possibly adding `--shell-escape`, and also adding the indexing program.

```
\newcommand*{\LWR@latexmkcmd}[1]{%

`\LWR@latexmkdvipdfm` {⟨*dvipdfm or dvipdfmx*⟩}

Adds the options settings for *dvipdfm* or *dvipdfmx*.

```

`\LWR@compileuplatex` Sets compile options for upLaTeX with ujarticle or related classes.

```

```

\LWR@PrintLatexCmd
\LWR@HTMLLatexCmd

If not set by the user, the following sets the command to use to compile the source to PDF form.

If using *latexmk*, a complicated string is created, eventually resulting in something such as:

For *xelatex* with `--shell-escape`:

```
[[latexmk   -xelatex   --shell-escape  -recorder
    -e '$makeindex = q/makeindex -s lwarp.ist/'  <jobname>_html]]
```

For *dvipdfmx*:

```
[[latexmk   -pdfdvi  -e '$dvipdf=q/dvipdfmx %O -o %D %S/'
    -recorder
    -e '$makeindex=q/makeindex -s lwarp.ist/'   <jobname>_html]]
```

For the following, temporary values are computed, but the permanent values are only set if the originals were not assigned by the user.

```
\ifbool{LWR@latexmk}{
```

For *latexmk* with *pdflatex* or *lualatex*:

```
    \ifpdf
```

For *latexmk* with *pdflatex*:

```
        \ifPDFTeX
            \def\LWR@latexcmd{\LWR@latexmkcmd{-pdf -dvi- -ps-}}
        \else
```

For *latexmk* with *lualatex*:

```
            \ifLuaTeX
                \def\LWR@latexcmd{\LWR@latexmkcmd{-lualatex}}
            \else
                \LWR@unknownengine
            \fi
        \fi
    \else% \ifpdf
```

For *latexmk* with *xelatex* or DVI *latex*:

```
        \ifXeTeX
```

For *latexmk* with *xelatex*:

```
            \def\LWR@latexcmd{\LWR@latexmkcmd{-xelatex}}
        \else% \ifXeTeX
```

For *latexmk* with DVI *latex*:

```
            \ifbool{LWR@dvipdfm}{
                \def\LWR@latexcmd{%
                    \LWR@latexmkcmd{%
                        \LWR@latexmkdvipdfm{dvipdfm}%
                    }
                }
            }{
                \ifbool{LWR@dvipdfmx}{
                    \def\LWR@latexcmd{%

                            \LWR@latexmkdvipdfm{dvipdfmx}%
                        }
                    }
                }{
                    \def\LWR@latexcmd{\LWR@latexmkcmd{-pdfps}}
                }
            }
        \fi
    \fi% \ifpdf
```

The final assignment if *latexmk*:

```
    \def\LWR@tempprintlatexcmd{\LWR@latexcmd \space \jobname}
    \def\LWR@tempHTMLlatexcmd{\LWR@latexcmd \space \jobname_html}
}% latexmk
```

Without *latexmk*, the compiling command is simply the compiler name and the optional shell escape:

```
{% not latexmk
    \ifpdf
```

For *pdflatex* or *lualatex*:

```
        \ifPDFTeX
```

For *pdflatex*:

```
            \def\LWR@tempprintlatexcmd{\LWR@compilecmd{pdflatex}{}}
            \def\LWR@tempHTMLlatexcmd{\LWR@compilecmd{pdflatex}{_html}}
        \else
            \ifLuaTeX
```

For *lualatex*:

```
                \def\LWR@tempprintlatexcmd{\LWR@compilecmd{lualatex}{}}
                \def\LWR@tempHTMLlatexcmd{\LWR@compilecmd{lualatex}{_html}}
            \else
                \LWR@unknownengine
            \fi
        \fi
    \else% \ifpdf
```

For DVI *latex* or *xelatex*:

```
        \ifXeTeX
```

For *xelatex*:

```
            \def\LWR@tempprintlatexcmd{\LWR@compilecmd{xelatex}{}}
            \def\LWR@tempHTMLlatexcmd{\LWR@compilecmd{xelatex}{_html}}
        \else
```

For DVI *latex*. Default to *dvips*, unless told to use *dvipdfm* or *dvipdfmx*:

```
            \ifbool{LWR@dvipdfm}{
```

For DVI *latex* with *dvipdfm*:

```
                \def\LWR@tempprintlatexcmd{%

                }
            }{
                \ifbool{LWR@dvipdfmx}{

For DVI *latex* with *dvipdfmx*:

```

                    }
                }{% dvips
```

For DVI *latex* with *dvips* and *ps2pdf*:

```
                    \def\LWR@tempprintlatexcmd{%
                        \LWR@compilecmd{latex}{}

            }
        \fi% \ifXeTeX
    \fi% \ifpdf

For ujarticle, utarticle, and related, using upLaTeX and *dvipdfmx*:

```
\IfClassLoadedTF{ujarticle}{\LWR@compileuplatex}{}

Only make the setting permanent if the original was empty:

```
\ifdefempty{\LWR@PrintLatexCmd}{
    \def\LWR@PrintLatexCmd{\LWR@tempprintlatexcmd}
}{}
\ifdefempty{\LWR@HTMLLatexCmd}{
    \def\LWR@HTMLLatexCmd{\LWR@tempHTMLlatexcmd}
}{}
```

`\LWR@writeconf` {⟨*filename*⟩}

Common code for each of `lwarpmk.conf` and `<project>.lwarpmkconf`. Each entry is a variable name, the equal sign, and a quoted string inside `[[` and `]]`, which are *lua*'s long quote characters, allowing the use of single and double quotes inside.

40.3.2 `lwarpmk.conf`

File `lwarpmk.conf`

`lwarpmk.conf` is automatically (re-)created by the lwarp package when executing
`pdflatex <project.tex>`,
or similar for *xelatex* or *lualatex*, in print-document generation mode, which is the default unless the `warpHTML` option is given. `lwarpmk.conf` is then used by the utility *lwarpmk*.

Config file:

```
\begin{LWRwriteconf}

\AtBeginDocument{\LWR@writeconf{lwarpmk.conf}}

\end{LWRwriteconf}
```

40.3.3 <project>.lwarpmkconf

File project.lwarpmkconf

A project-specific configuration file for *lwarpmk*.

The makeindex and xindy options have already been handled for lwarp.conf.

Config file:

```
\begin{LWRwriteconf}

\AtBeginDocument{\LWR@writeconf{\jobname.lwarpmkconf}}

\end{LWRwriteconf}
```

40.4 lwarp.css

File lwarp.css

This is the base css layer used by lwarp.

This must be present both when compiling the project and also when distributing the HTML files.

Config file:

40.7 sample_project.css

File sample_project.css

The project-specific css file. Use with \CSSFilename.

If used, this must be present both when compiling the project and also when distributing the HTML files.

Config file:

```
\begin{LWRwriteconf}
\begin{filecontents*}[overwrite]{sample_project.css}
/* ( --- Start of project.css --- ) */
/* ( --- A sample project-specific CSS file for lwarp --- ) */

/* @import url("lwarp_sagebrush.css") ; */

/* Project-specific CSS setting follow here. */
/* . . . */

/* ( --- End of project.css --- ) */
\end{filecontents*}
% \end{Verbatim}% for syntax highlighting
\end{LWRwriteconf}
```

40.8 lwarp.ist

File lwarp.ist

Used to modify the index for lwarp.

This must be present when compiling the project, but does not need to be present when distributing the resulting HTML files.

The page compositor line is for memoir's \specialindex.

Config file:

```
\begin{LWRwriteconf}

40.9 lwarp.xdy

File lwarp.xdy

Used to modify the index for lwarp.

This must be present when compiling the project, but does not need to be present when distributing the resulting HTML files.

See:
https://tex.stackexchange.com/questions/80300/how-can-i-convince-hyperref-and-xindy-to-play-together-nicely

40.10 lwarp_one_limage.cmd

File lwarp_one_limage.cmd

Used by lwarp to help make lateximages when using WINDOWS.

This must be present when compiling the project, but does not need to be present when distributing the resulting HTML files.

The arguments are each of the three fields from <project>-images.txt, and also the base name of the source file.

MiKTeX does not allow file lwarp_one_limage.cmd to be created directly by *lwarpmk*, so lwarp_one_limage.txt is created instead, then copied to lwarp_one_limage.cmd by *lwarpmk*. This occurs each time *lwarpmk* used to create lateximages.

Config file:
```

40.11 lwarp_mathjax.txt

(*Emulates or patches code by* Davide P. Cervone.)

File `lwarp_mathjax.txt`

The default MathJax script used by lwarp when using MathJax. A recent version of MathJax is used, as served by the recommended repository. Adjustments are made to allow LaTeX to control the equation tags and provide for starred macros.

`\MathJaxFilename` determines which script file is copied into the HTML pages, and defaults to `lwarp_mathjax.txt`. The script files must be present when compiling the project, but do not need to be present when distributing the resulting HTML files.

custom script

To generate a custom script, such as to use a local repository, copy `lwarp_mathjax.txt` to a new file, make changes while keeping lwarp's adjustments for equation numbering and starred macros, and use `\MathJaxFilename` to select the new filename.

Config file:
```
\begin{LWRwriteconf}
\begin{filecontents*}[overwrite]{lwarp_mathjax.txt}

// \left, \right delimiters: https://github.com/mathjax/MathJax/issues/2535
//
// Modified by Brian Dunn to adjust equation numbering and add subequations.
//
// LaTeX can use \seteqnumber{subequations?}{section}{number} before each equation.

// section is a string printed as-is, or empty.
// number is auto-incremented by MathJax between equations.

40.12 `lwarpmk.lua` — `lwarpmk` option

Opt `lwarpmk`

Creates a local copy of *lwarpmk*.

Prog `lwarpmk`

Command-line utility to process lwarp files and images.

parallel processing

`lateximages` and SVG math images are generated using multiple processes in parallel. For UNIX and LINUX, every 32 images the `wait` command is issued to wait for the previous batch of images to finish processing before starting a new batch. For WINDOWS, every 32 images one task is dispatched with

```
START /B /WAIT /BELOWNORMAL
```

which causes the operating system to wait until this lesser-priority tasks finishes, hopefully also waiting for the normal priority tasks which were already in progress to also complete. Afterwards, the next batch of images is started.

The following is only generated if the `lwarpmk` option was given to lwarp.

```

41 Stacks

for HTML output:

```
\begin{warpHTML}
```

Stacks are used to remember how to close sections and list items. Before a new section is started, previously nested sections and items must be closed out (un-nested) in proper order. Note that starting a new section may close several levels of previously nested items at the same time. For example, starting a new `\section` would close any currently open subsection, subsubsection, and paragraph. General environments are not nested on the stack since they have their own close mechanism. List environments are nested, and items inside those environments are nested one level deeper still. List environments may be nested inside other list environments, and list items are nested inside list environments as well. Thus, the stack may have items which are not necessarily in order, since a description may contain an enumerate, for example. Depths to be recorded in `\LWR@closedepthone`, etc.

41.1 Assigning depths

initial depths for empty stack entries:

```
\newcommand*{\LWR@depthnone}{-5}
```

All sectioning depths are deeper than `LWR@depthfinished`:

```
\newcommand*{\LWR@depthfinished}{-4}
\newcommand*{\LWR@depthbook}{-2}
\newcommand*{\LWR@depthpart}{-1}
\newcommand*{\LWR@depthchapter}{0}
\newcommand*{\LWR@depthsection}{1}
\newcommand*{\LWR@depthsubsection}{2}
\newcommand*{\LWR@depthsubsubsection}{3}
\newcommand*{\LWR@depthparagraph}{4}
\newcommand*{\LWR@depthsubparagraph}{5}
```

Used by `\itemize`, `\enumerate`, `\description`:

```
\newcommand*{\LWR@depthlist}{6}
```

Used by `\item`:

```
\newcommand*{\LWR@depthlistitem}{7}
\let\LWR@depthdescitem\LWR@depthlistitem
```

41.2 Closing actions

A stack to record the action to take to close each nesting level: Add more levels of stack if necessary for a very deeply nested document, adding to `\pushclose` and `\popclose` as well.

```
\newcommand*{\LWR@closeone}{}% top of the stack
\newcommand*{\LWR@closetwo}{}
\newcommand*{\LWR@closethree}{}
\newcommand*{\LWR@closefour}{}
\newcommand*{\LWR@closefive}{}
\newcommand*{\LWR@closesix}{}
\newcommand*{\LWR@closeseven}{}
\newcommand*{\LWR@closeeight}{}
\newcommand*{\LWR@closenine}{}
\newcommand*{\LWR@closeten}{}
\newcommand*{\LWR@closeeleven}{}
\newcommand*{\LWR@closetwelve}{}
\newcommand*{\LWR@closethirteen}{}
\newcommand*{\LWR@closefourteen}{}
\newcommand*{\LWR@closefifteen}{}
\newcommand*{\LWR@closesixteen}{}
\newcommand*{\LWR@closeseventeen}{}
\newcommand*{\LWR@closeeighteen}{}
\newcommand*{\LWR@closenineteen}{}
```

41.3 Closing depths

A stack to record the depth of each level:

⚠ Note that nested LaTeX structures may push depths which are non-sequential.

Ex:

```
\begin{itemize}
   \item{A}
   \begin{description}
      \item{B}
   \end{description}
\end{itemize}
```

```
\newcommand*{\LWR@closedepthone}{\LWR@depthnone}% top of the stack
\newcommand*{\LWR@closedepthtwo}{\LWR@depthnone}
\newcommand*{\LWR@closedepththree}{\LWR@depthnone}
\newcommand*{\LWR@closedepthfour}{\LWR@depthnone}
\newcommand*{\LWR@closedepthfive}{\LWR@depthnone}
\newcommand*{\LWR@closedepthsix}{\LWR@depthnone}
\newcommand*{\LWR@closedepthseven}{\LWR@depthnone}
\newcommand*{\LWR@closedepteight}{\LWR@depthnone}
\newcommand*{\LWR@closedepthnine}{\LWR@depthnone}
\newcommand*{\LWR@closedepthten}{\LWR@depthnone}
\newcommand*{\LWR@closedeptheleven}{\LWR@depthnone}
\newcommand*{\LWR@closedepthtwelve}{\LWR@depthnone}
\newcommand*{\LWR@closedepththirteen}{\LWR@depthnone}
\newcommand*{\LWR@closedepthfourteen}{\LWR@depthnone}
```

```
\newcommand*{\LWR@closedepthfifteen}{\LWR@depthnone}
\newcommand*{\LWR@closedepthsixteen}{\LWR@depthnone}
\newcommand*{\LWR@closedepthseventeen}{\LWR@depthnone}
\newcommand*{\LWR@closedeptheighteen}{\LWR@depthnone}

42 Data arrays

These macros are similar to the arrayjobx package, except that `\LWR@setexparray`'s argument is expanded only once when assigned.

`name` has no backslash, `index` can be a number or a text name, and an empty `value` must be `\relax` instead of empty.

To assign an empty value:

```
\LWR@setexparray{name}{index}{}
```

for HTML output:

```
\begin{warpHTML}
```

`\LWR@setexparray` {⟨*name*⟩} {⟨*index*⟩} {⟨*contents*⟩}

```
\newbool{LWR@setexparray@doingparhooks}

\NewDocumentCommand{\LWR@setexparray}{m m m}{%
```

Temporarily disable paragraph handling during the assignment. This is not done in a group with global assignments because a table may be nested.

44 Localizing dynamic math

Inline SVG math usually uses a hash of its contents to generate `lateximages` which are reusable for multiple instances with the same contents. If the contents may change for each use, such as depending on the current value of a counter, then `\inlinemathother` must be used before the inline math expression, and `\inlinemathnormal` must be used after.

For MathJax, the inline math expression is usually printed for MathJax to interpret. When marked as dynamic math, the following inline math expression will be displayed as an unhashed inline SVG image instead.

For existing code and packages, it may be possible to patch macros after they have been defined, using the xpatch package, which is pre-loaded by lwarp:

```
\xpatchcmd{\macroname}
    {$math expression$}
    {\inlinemathother$math expression$\inlinemathnormal}
    {}
    {\typeout{Error patching macroname.}}
```

for HTML & PRINT:

```

46 HTML filename generation

The filename of the homepage is set to \HomeHTMLFilename.html. The filenames of additional sections start with \HTMLFilename, to which is appended a section number or a simplified section name, depending on FileSectionNames.

for HTML & PRINT:

```
6041 \begin{warpall}
```

\BaseJobname The \jobname of the printed version, even if currently compiling the HTML version. I.e. this is the \jobname without _html appended. This is used to set \HomeHTMLFilename if the user did not provide one.

```
6042 \providecommand*{\BaseJobname}{\jobname}
```

\HTMLFilename The prefix for all generated HTML files other than the home page, defaulting to empty. See section 7.6.1.

```
6043 \providecommand*{\HTMLFilename}{}
```

\HomeHTMLFilename The filename of the home page, defaulting to the \BaseJobname. See section 7.6.1.

```
6044 \providecommand*{\HomeHTMLFilename}{\BaseJobname}
```

\SetHTMLFileNumber {⟨*number*⟩}

Sets the file number for the next file to be generated. 0 is the home page. Use just before the next sectioning command, and set it to one less than the desired number of the next section. May be used to generate numbered groups of nodes such as 100+ for one chapter, 200+ for another chapter, etc.

Ctr LWR@htmlseqfilenumber

A sequential count of the number of each HTML file as it is being created. Number 0 is the home page. Unlike `\LWR@htmlfilenumber`, this one is known to increment by one for each file. This is used to generate previous /next links for each web page, via labels called `\BaseJobname-autofile-*`, and the last page is also labelled `\BaseJobname-autofile-last`.

```
\newcounter{LWR@htmlseqfilenumber}
\setcounter{LWR@htmlseqfilenumber}{0}
```

Bool LWR@setseqfilelabel

At each new HTML file, this is false until a sectional unit is used, at which point this is set true and a label is placed. In this way, the previous/next labels will point to a named section.

```
\newbool{LWR@setseqfilelabel}
\setbool{LWR@setseqfilelabel}{false}
```

Ctr LWR@htmlfilenumber

Records the number of each HTML file as it is being created. Number 0 is the home page. This might not be sequential, as the user may use `\SetHTMLFileNumber` to create groups of numbered nodes.

```
\newcounter{LWR@htmlfilenumber}
\setcounter{LWR@htmlfilenumber}{0}

For a LaTeX section named “Index” or “index” without a prefix, create a filename with a trailing `-0` to avoid colliding with the HTML filename `index.html`:

```
{%

    \ifboolexpr{
            test{\ifdefvoid{\HTMLFilename}} and
            (
                test{\ifdefstring{\LWR@sanitized}{Index}} or
                test{\ifdefstring{\LWR@sanitized}{index}}

    {%
        \LWR@traceinfo{Adding a zero to the index filename.}%
        \LWR@sanitized-0.html%

Otherwise, create a filename with the chosen prefix:

52.10 High-level block and inline classes

These are high-level commands which allow the creation of arbitrary block or inline sections which may be formatted with css.

Nullified versions are provided for print mode.

For other direct-formatting commands, see section 95.

Env `BlockClass` [⟨*style*⟩] (⟨*aria role*⟩) {⟨*class*⟩} High-level interface for `<div>` classes.

Ex: `\begin{BlockClass}{class}` text `\end{BlockClass}`

for HTML & PRINT:

```
\begin{warpall}
\NewDocumentEnvironment{BlockClass}{o D(){} m}{}{}
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}

\NewDocumentEnvironment{LWR@HTML@BlockClass}{o D(){} m}%
```

```
    {\LWR@htmldivclass[#1](#2){#3}}%
    {\LWR@htmldivclassend{#3}}

\LWR@formattedenv{BlockClass}
\end{warpHTML}
```

`\BlockClassSingle` {⟨*class*⟩} {⟨*text*⟩} A single-line , without a paragraph tag for the line of text.

for HTML & PRINT:

```
\begin{warpall}
\newcommand{\BlockClassSingle}[2]{#2}
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}
\newcommand{\LWR@HTML@BlockClassSingle}[2]{%

}

\LWR@formatted{BlockClassSingle}
\end{warpHTML}
```

`\InlineClass` (⟨*WP style*⟩) [⟨*style*⟩] {⟨*class*⟩} {⟨*text*⟩}

High-level interface for inline span classes.

(⟨*WP style*⟩) is css styling to add when formatting for a word processor import.

[⟨*style*⟩] is the css styling to add when not formatting for a word processor.

for HTML & PRINT:

```
\begin{warpall}
\NewDocumentCommand{\InlineClass}{D{(}{)}{} o m +m}{#4}%

The use of `\textquotedbl` instead of " provides improved compatibility with xeCJK.

for HTML & PRINT:

```
\begin{warpall}

52.11 Closing HTML tags

for HTML output:

\newcommand*{\LWR@printclosesubparagraph}

53 Paragraph handling

These commands generate the HTML paragraph tags when allowed and required.

Paragraph tags are or are not allowed depending on many conditions. Section 54 has high-level commands which allow paragraph-tag generation to start/stop. Even when allowed (`LWR@doingstartpars`), tags are not generated until a LaTeX paragraph is being used (`LWR@doingapar`). `LWR@lateximagedepth` is used to prevent nesting tags inside a `lateximage`. `LWR@spandepth` is used to prevent nesting paragraph tags inside a paragraph, which became important inside `\fbox` commands and other spans.

The LaTeX paragraph hooks are used to manage tag creation.

for HTML output:

```
\begin{warpHTML}
```

Ctr `LWR@spandepth`

Do not create paragraph tags inside of an HTML span.

```
\newcounter{LWR@spandepth}
\setcounter{LWR@spandepth}{0}
```

Bool `LWR@doingparhooks`

Tells whether the lwarp paragraph hooks are to be active.

```
\newbool{LWR@doingparhooks}
\boolfalse{LWR@doingparhooks}
```

Bool `LWR@in@multirow@par`

Tells whether to generate break instead of paragraph tags inside a `\multirow`.

```
\newbool{LWR@in@multirow@par}
\boolfalse{LWR@in@multirow@par}
```

Bool `LWR@starting@fancybox`

Suppresses <br> if beginning a fancybox environment.

```
\newbool{LWR@starting@fancybox}
\boolfalse{LWR@starting@fancybox}
```

Bool `LWR@doingstartpars`

Tells whether paragraphs may be generated.

```
\newbool{LWR@doingstartpars}

```
6630 \newbool{LWR@doingapar}
6631 \global\boolfalse{LWR@doingapar}
```

Bool LWR@algocf@dopars

```
6632 \newbool{LWR@algocf@dopars}

54 Paragraph start/stop handling

These commands allow/disallow the generation of HTML paragraph tags.

Section 53 has the commands which actually generate the tags.

The LaTeX paragraph hooks are used to generate the opening and closing paragraph tags.

for HTML output:

```
\begin{warpHTML}
```

\LWR@startpars Begin handling HTML paragraphs. This allows an HTML paragraph to start, but one has not yet begun.

```
\newcommand*{\LWR@startpars}%
{%
```

Ignore if inside a lateximage or :

```
    \ifboolexpr{
        test {\ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}} or
        test {\ifnumcomp{\value{LWR@spandepth}}{>}{0}}
    }%
        {}% nesting
        {% not nesting

The LaTeX paragraph hook controls tag generation for the start and end of paragraphs.

See if currently handling HTML paragraphs:

55 Indentfirst

Pkg indentfirst

indentfirst redefines `\@afterindentfalse` to be `\@afterindenttrue`. This is reversed `\AtBeginDocument` here.

for HTML output:

58 MathJax script

for HTML output:
Default: lwarp_mathjax.txt

```
\begin{warpHTML}
```

\LWR@mathjaxfilename The MathJax script filename to use. This file is copied into the head of each HTML page. This may be changed mid-document using \MathJaxFilename, allowing the use of a custom MathJax script, such as for a local repository, or different MathJax script files to be used for different sections of the document.

```
\newcommand*{\LWR@mathjaxfilename}{lwarp_mathjax.txt}

\end{warpHTML}
```

for HTML & PRINT:

```
\begin{warpall}

`\HTMLAuthor` {⟨*authorname*⟩} The author to place into an HTML meta tag. If none given, the default is `\theauthor`, which is empty unless the titling package is used.

```
\providecommand{\theauthor}{}

\newcommand{\theHTMLAuthor}{\theauthor}

\newcommand{\HTMLAuthor}[1]{\renewcommand{\theHTMLAuthor}{#1}}
```

This is placed inside an HTML meta tag at the start of each file. This may be changed mid-document using `\HTMLDescription`, allowing different HTML descriptions to be used for different sections of the document.

⚠ HTML author Do not use double quotes, and do not exceed 150 characters.

`\HTMLDescription` {⟨*New html meta description.*⟩} Assigns the HTML file's description meta tag.

```
\newcommand{\LWR@currentHTMLDescription}{}

60 Footnotes

lwarp uses native LaTeX footnote code, although with its own \box to avoid the LaTeX output routine. The usual functions mostly work as-is.

footnote numbering

To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For bigfoot, manyfoot, or perpage:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by FootnoteDepth, which is not necessarily by HTML page. This is recommended for \alph, \Alph, or \fnsymbol footnotes, due to the limited number of symbols which are available.

MathJax

Also for MathJax, \footnotename is used for a \footnotemark if the actual footnote number is not known. To redefine it, provide it before loading lwarp:

```
\providecommand{\footnotename}{something}
\usepackage{lwarp}
```

Similar for sidenotes. For endnotes:

```
\def\endnotename{something}% \def allows name to start with
"end"
```

For the pagenote package, there is no \pagenotename to define, since there is no \pagenotemark command.

footmisc

The footmisc stable option is emulated by lwarp.

⚠ sectioning commands

When using footnotes in sectioning commands, to generate consistent results between print and HTML, use the footmisc package with the stable option, provide a short TOC entry, and \protect the \footnote:

```
\usepackage[stable]{footmisc}
. . .
\subsection[Subsection Name]
    {Subsection Name\protect\footnote{A footnote.}}
```

memoir with footmisc
⚠ memoir

If using memoir class, with which lwarp preloads footmisc, the stable option must be declared before lwarp is loaded:

```
\PassOptionsToPackage{stable}{footmisc}
\usepackage{lwarp}
. . .
```

Do not use a starred sectioning command. As an alternative, it may be possible to adjust \secnumdepth instead.

Several kinds of footnotes are used: in a regular page, in a minipage, or as thanks in the titlepage. Each of these is handle differently.

60.1 Regular page footnotes

In HTML documents, footnotes are placed at the bottom of the web page or the section, depending on FootnoteDepth, using the LaTeX box \LWR@footnotebox. Using this instead of the original \footins box avoids having footnotes be printed by the output routine, since footnotes should be printed per HTML page instead of per PDF page.

See section 60.4 for the implementation.

60.2 Minipage footnotes

See section 60.5 for how minipage footnotes are gathered. See section 94.4 for how minipage footnotes are placed into the document.

60.3 Titlepage thanks

See section 69.7 for titlepage footnotes.

60.4 Regular page footnote implementation

for HTML & PRINT:

```
\begin{warpall}
```

Ctr FootnoteDepth

Default: 3

Determines how deeply to place footnotes in the HTML files, similar to tocdepth. The default of 3 places footnotes before each \subsubsection or higher. See table 12 for a table of LaTeX section headings.

```
\newcounter{FootnoteDepth}
\setcounter{FootnoteDepth}{3}
```

Ctr footnoteReset

Default: 0

If non-zero, the footnote counter is reset to this value each time the footnotes are printed, as controlled by FootnoteDepth. For the manyfoot and bigfoot packages, additional counters such as footnote<suffix>Reset will be defined as well. These counters may be set non-zero by the user, and are also set if the perpage's \MakePerPage or \MakeSortedPerPage macros are used for the footnote or footnote<suffix> counters.

(The name is not capitalized because it is made from the counter's name with "Reset" appended.)

```
\newcounter{footnoteReset}
\setcounter{footnoteReset}{0}
```

```
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}
```

Required for footnotes inside `description` or amstheorem square braces:

```
\AtBeginDocument{
\robustify{\footnote}
\robustify{\footnotemark}
}
```

`\LWR@footnotebox` Patch LaTeX footnotes to use a new `\box` instead of an insert for lwarp footnotes. This avoids having the original `\footins` appear at the bottom of a `lateximage`, which is on its own new page.

```
\newbox\LWR@footnotebox
```

Bool `LWR@spewingnotes` Used with the footnote package to suppress paragraph tags before and after `\spewnotes`.

```
\newbool{LWR@spewingnotes}% For the footnote package.
```

Much of the following has unneeded print-mode formatting removed.

`\@makefntext` {⟨*text*⟩}

```
\long\def\@makefntext#1{\textsuperscript{\@thefnmark}~{#1}}
```

`\@makefnmark`

```
\def\@makefnmark{%
    \textsuperscript{\@thefnmark}%
}
```

Footnotes may be in regular text, in which case paragraphs are tagged, or in a table data cell or `lateximage`, in which case paragraph tags must be added manually.

In a `lateximage` during HTML output, the `lateximage` is placed inside a print-mode `minipage`, but the footnotes are broken out by:

```
\def\@mpfn{footnote}
\def\thempfn{\thefootnote}
\let\@footnotetext\LWR@footnotetext
```

`\LWR@@footnotetext` {⟨*text*⟩} {⟨*footnote box name*⟩}

Factored to allow multiple footnote boxes for manyfoot.

```
\long\def\LWR@@footnotetext#1#2{%
\LWR@traceinfo{LWR@footnotetext}%
```

Perhaps generate an autopage in the text to link a citation backreference closer to its usage.

```
\LWR@newautopagelabel{page}%
\LWR@ensuredoingapar%
```

Locally disable auto page labels inside the footnote text. Footnotes are accumulated in the current page before finally being placed in a potentially later page, so the autopages would be incorrect.

```
\begingroup%
\let\LWR@newautopagelabel\LWR@null@newautopagelabel%
```

Take the existing footnote box and add the new content:

```
\global\setbox\csname #2\endcsname=\vbox{%
    \unvbox\csname #2\endcsname%
```

Remember the footnote number for `\ref`:

```
    \protected@edef\@currentlabel{%
        \csname p@footnote\endcsname\@thefnmark%
    }% @currentlabel
```

Open a group:

```
    \color@begingroup%
```

Disable CJK xpinyin while generating footnotes.

```
    \LWR@disablepinyin%
```

Use HTML superscripts in the footnote even when the main text is inside a `lateximage`, because the footnote will be in HTML:

```
    \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%
```

Use paragraph tags if in a tabular data cell or a `lateximage`:

```
    \ifbool{LWR@spewingnotes}{}{%
        \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
    }%
```

Append the footnote to the list:

```
    \@makefntext{#1}%
```

Closing paragraph tag:

```
    \ifbool{LWR@spewingnotes}{}{%
        \LWR@origtilde\LWR@orignewline%
        \LWR@htmltagc{/\LWR@tagregularparagraph}%
        \LWR@orignewline%
    }%
```

Close the group:

```
    \color@endgroup%
}% vbox
\endgroup%
}%
```

`\LWR@footnotetext` {⟨*text*⟩}

```
\long\def\LWR@footnotetext#1{\LWR@@footnotetext{#1}{LWR@footnotebox}}%
```

`\@footnotetext` {⟨*text*⟩}

```
\LetLtxMacro\@footnotetext\LWR@footnotetext
```

60.5 Minipage footnote implementation

Patch LaTeX minipage footnotes to use a new `\box` instead of an insert for lwarp minipage footnotes. This avoids having the original `\@mpfootins` appear at the bottom of a `lateximage`, which is on its own new page.

```
\newbox\LWR@mpfootnotes
```

`\@mpfootnotetext` {⟨*text*⟩}

```
\long\def\@mpfootnotetext#1{%
\LWR@traceinfo{@mpfootnotetext}%
\LWR@ensuredoingapar%
\global\setbox\LWR@mpfootnotes\vbox{%
    \unvbox\LWR@mpfootnotes%
    \reset@font\footnotesize%
    \hsize\columnwidth%
    \@parboxrestore%
    \protected@edef\@currentlabel%
        {\csname p@mpfootnote\endcsname\@thefnmark}%
    \color@begingroup%
```

Add paragraph tag:

```
    \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%

    \@makefntext{%
        \ignorespaces#1%
    }%
```

Add the closing paragraph tag:

```
    \leavevmode\LWR@orignewline%
    \LWR@htmltagc{/\LWR@tagregularparagraph}%

    \color@endgroup%
}% vbox
```

Paragraph handling:

```
\LWR@ensuredoingapar%
\LWR@traceinfo{@mpfootnotetext: done}%
}
```

`\thempfootnote` Redefined to remove the `\itshape`, which caused an obscure compiling error in some situations.

```
\AtBeginDocument{
    \def\thempfootnote{\@alph\c@mpfootnote}
}
```

60.6 Printing pending footnotes

\LWR@@printpendingfootnotes {⟨*footnote counter name*⟩}

```
\newcommand*{\LWR@@printpendingfootnotes}[1]{%
\expandafter\ifvoid\csname LWR@#1box\endcsname\else
    \LWR@forcenewpage
    \begin{BlockClass}(note){footnotes}%
```

Create a new autopage in case citation back references occur inside the footnotes:

```
    \LWR@newautopagelabel{page}%

    \null
    \unvbox\csuse{LWR@#1box}
    \setbox\csuse{LWR@#1box}=\vbox{}
    \end{BlockClass}
    \ifltxcounter{#1Reset}{%
        \ifnumgreater{\value{#1Reset}}{0}{%
            \setcounter{#1}{\value{#1Reset}}%
            \addtocounter{#1}{-1}%
        }{}%
    }{}%
\fi
}
```

\LWR@printpendingfootnotes Enclose the footnotes in a class, print, then clear. For manynotes, new footnotes may be added via \appto.

```
\newcommand*{\LWR@printpendingfootnotes}{%
    \LWR@@printpendingfootnotes{footnote}%
}
```

\LWR@maybeprintpendingfootnotes {⟨*depth*⟩} Used to print footnotes before sections only if formatting for an EPUB or word processor:

```
\newcommand*{\LWR@maybeprintpendingfootnotes}[1]{%
\ifboolexpr{
    not test{\ifnumcomp{#1}{>}{\value{FootnoteDepth}}} or
    bool{FormatEPUB} or
    bool{FormatWP}
}%
{\LWR@printpendingfootnotes}%
{}%
}
```

\LWR@printpendingmpfootnotes Enclose the minipage footnotes in a class, print, then clear.

```
\newcommand*{\LWR@printpendingmpfootnotes}{%
\ifvoid\LWR@mpfootnotes\else
    \LWR@forcenewpage
    \begin{BlockClass}(note){footnotes}%
    \null
    \unvbox\LWR@mpfootnotes
    \setbox\LWR@mpfootnotes=\vbox{}
    \end{BlockClass}
```

```
\fi
}
```

`\LWR@nullifyfootnotes` Cancels footnotes, such as inside an HTML comment or a `\nameref`.

```
\newcommand*{\LWR@nullifyfootnotes}{%
    \renewcommand{\footnote}[2][]{}%
    \renewcommand{\footnotemark}[1][]{}%
}
```

```
\end{warpHTML}
```

61 Marginpars

`\marginpar` `[`⟨*left*⟩`]` `{`⟨*right*⟩`}` `\marginpar` may contains paragraphs, but in order to remain inline with the surrounding text lwarp nullifies block-related macros inside the `\marginpar`. Paragraph breaks are converted to `<br />` tags.

`\marginparBlock` `[`⟨*left*⟩`]` `{`⟨*right*⟩`}` To include block-related macros, use `\marginparBlock`, which takes the same arguments but creates a `<div>` instead of a `<span>`. A line break will occur in the text where the `\marginBlock` occurs.

for HTML output:

```
\begin{warpHTML}
```

`\marginpar` `[`⟨*left*⟩`]` `{`⟨*right*⟩`}`

```
\renewcommand{\marginpar}[2][]{%
\ifbool{FormatWP}%

```

`\marginparBlock` `[`⟨*left*⟩`]` `{`⟨*right*⟩`}`

62 Tracking internal cross references

Cross references are generated using the PDF file's page number during LaTeX compilation. Internal labels are generated which include these page numbers in the label.

File *_html.aux

A new entry in the *_html.aux file is used to help cross-references:

```
\newlabel{autopage-<nnn>}{{<x>}{<y>}}
```

Ctr LWR@currentautosecpage

Records the page number when the section was created. (If a math expression is included in the section name, and SVG math is used, the corresponding lateximage will cause the page number to change by the time the following autosec label is created, thus the initial page number is recorded here.) LWR@currentautosecfloatpage is updated more often than LWR@currentautosecpage.

```
\newcounter{LWR@currentautosecpage}
\setcounter{LWR@currentautosecpage}{1}
```

Ctr
LWR@currentautosecfloatpage

The HTML output's PDF page number at the start of a new HTML file, section, or float. Updated more often than LWR@currentautosecpage, such as when a new float occurs. Used only for table of contents, list of figures, list of tables, but not for general cross references such as \label, citation backlinks, etc.

\LWRsetnextfloat is written with this and the autoid by the modified \addcontentsline just before each float's entry.

```
\newcounter{LWR@currentautosecfloatpage}
\setcounter{LWR@currentautosecfloatpage}{1}
```

Ctr
LWR@previousautopagelabel

Remembers which autopage label was most recently generated. Used to avoid duplicates.

```
\newcounter{LWR@previousautopagelabel}
\setcounter{LWR@previousautopagelabel}{-1}
```

\LWR@newautopagelabel {⟨*pagenumber counter*⟩}

\BaseJobname is added to the label in case xr or xr-hyper are used.

```
\newcommand*{\LWR@newautopagelabel}[1]{%
```

No action if this autopage label has already been defined:

```
\ifnumequal{\value{LWR@previousautopagelabel}}{\value{page}}%
    {}%
```

If the PDF page has changed, create a label using the desired counter.

If the counter is LWR@currentautosecpage, that was the page number when the section generation began, but the current PDF page may be different by now if the section name had an SVG image, such as SVG math. To allow the cross-reference to point just after the section heading, the label must be made after the section heading is complete, which may have generated a new PDF page. Thus, the label is made with the given counter, which may be the PDF page number where the section heading began, then if the PDF page number has changed, another label is made for the current page number.

```
    {%
        \label{\BaseJobname-autopage-\csuse{the#1}}%
```

If there are intervening pages, such as an SVG image, define another label for the new page:

```
        \ifnumequal{\value{#1}}{\value{page}}%
            {}%
            {\label{\BaseJobname-autopage-\csuse{thepage}}}%
```

Remember the latest autopage label:

```
        \setcounter{LWR@previousautopagelabel}{\value{page}}%
    }%
}
```

\LWR@null@newautopagelabel {⟨*pagenumber counter*⟩}

Inside a footnote, the page numbers will be incorrect, so this is nullified.

```
\newcommand*{\LWR@null@newautopagelabel}[1]{}
```

63 Splitting HTML files

- Files are split according to `FileDepth` and `CombineHigherDepths`.
- Filenames are sanitized by `\LWR@filenamenoblanks`.
- `\LWR@newhtmlfile` finishes an HTML page, adds a comment to tell where and how to split the file, then starts a new HTML page.

for HTML & PRINT:

```
\begin{warpall}
```

Ctr `FileDepth` {⟨*section depth*⟩} determines how deeply to break into new HTML files, similar to `tocdepth`. The default of -5 produces one large HTML file.

```
\newcounter{FileDepth}
\setcounter{FileDepth}{-5}
```

Bool `CombineHigherDepths` Combile higher-level sections together into one file?

```
\newbool{CombineHigherDepths}
\booltrue{CombineHigherDepths}
```

`\FilenameLimit` Maximum length of the generated filenames.

```
\newcommand*{\FilenameLimit}{80}
```

```
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}
```

`\LWR@thisfilename` The currently-active filename or number. At first, this is the homepage.

```
\AtBeginDocument{
\ifbool{FileSectionNames}%
    {\newcommand*{\LWR@thisfilename}{\HomeHTMLFilename}}
    {\newcommand*{\LWR@thisfilename}{0}}

63.1 Sanitizing expressions for HTML

Math expressions are converted to latexmages, and some math environments may contain &, <, or >, which should not be allowed inside an HTML <alt> tag, so must convert them to HTML entities.

`\LWR@replacestrings` {⟨*search*⟩} {⟨*replace*⟩}

Replaces strings inside \tmpb.

Modified from the original, by Petr Olsak, from the opmac package.

```
\bgroup
\catcode`!=3 \catcode`?=3

\long\gdef\LWR@replacestrings@addto#1#2{%

Bool
LWR@MathJax@silentquotes

If true, double quotes (\" and ") are removed (used for mathspec). This unfortunately includes double quotes used inside \text with MathJax. If false, double quotes are escaped.

```
\newbool{LWR@MathJax@silentquotes}
\boolfalse{LWR@MathJax@silentquotes}
```

\LWR@subHTMLsanitize

\LWR@strresult must first be set by \LWR@HTMLsanitize, \LWR@HTMLsanitizeexpand, or \CustomizeMathJax.

```
\catcode`\#=12
\catcode`\&=12
\newcommand{\LWR@subHTMLsanitize}{%
```

The &, <, and > may be interpreted by the browser:

```
    \edef\tmpb{\detokenize\expandafter{\LWR@strresult}}%
    \LWR@replacestrings{&}{&amp;}%
    \LWR@replacestrings{<}{&lt;}%
    \LWR@replacestrings{>}{&gt;}%
```

The quotes occasionally causes problems. For mathspec, also allow neutralization of \" and the " character.

```
    \ifbool{LWR@MathJax@silentquotes}
        {%
            \expandafter\LWR@replacestrings\expandafter{\LWRbackslash"}{}%
            \LWR@replacestrings{"}{}%
        }%
        {\LWR@replacestrings{"}{&quot;}}%
    \LWR@replacestrings{'}{&apos;}%
    \LWR@replacestrings{`}{&grave;}%
```

MathJax allows expressions to be defined with \newcommand. These expressions would appear with ## for each argument, and each must be changed to a single

#. This must be done after all the above changes. Attempting another conversion after this causes an error upon further expansion.

```
    \LWR@replacestrings{##}{#}%

defaults Default customizations:

In the MathJax code, footnotes are only referenced. For equations, they are also generated in the HTML when the LaTeX math is generated inside the HTML comment. For other math environments, the `\footnotemark`/`\footnotetext` method must be used. See section 8.5.4 regarding `\footnotemark`.

⚠ `\footnotemark`

For footnotes, `\footnotename` is used in most cases, however for `equation` the footnote is picked up from LaTeXin `\LWR@doendequation`.

First, `\footnotename` for MathJax is copied from LaTeX.

```

\LWR@newhtmlfile {⟨*section name*⟩}

Finishes the current HTML page with footnotes, footer, navigation, then starts a new HTML page with an HTML comment telling where to split the page and what the new filename and CSS are, then adds navigation, side TOC, header, and starts the text body.

64 Sectioning

Sectioning and cross-references have been emulated from scratch, rather than try to patch several layers of existing LaTeX code and packages. Formatting is handled by css, so the emulated code has much less work to do than the print versions.

Unicode

⚠ accents in filenames

Section names and the resulting filenames with accented characters are partially supported, depending on the ability of *pdflatex* to generate characters and *pdftotext* to read them. If extra symbols appear in the text, it may be that *pdflatex* is actually producing a symbol over or under a character, resulting in *pdftotext* picking up the accent symbol separately.

XeLaTeX and LuaLaTeX directly support accented section and file names, but it may be necessary to use LaTeX accents instead of native Unicode accents. LaTeX accents will have the accents stripped when creating file names, whereas using Unicode accents will create filenames which include accents, which may cause issues with some operating systems.

64.1 User-level starred section commands

`\ForceHTMLPage`

For HTML output, forces the next section to be on its own HTML page, if `FileDepth` allows, even if starred. For use with `\printindex` and others which generate a starred section which should be on its own HTML page. Also see `\ForceHTMLTOC`.

For print output, no effect.

```
\newbool{LWR@forcinghtmlpage}
\boolfalse{LWR@forcinghtmlpage}
```

```
\newcommand*{\ForceHTMLPage}{%
\global\booltrue{LWR@forcinghtmlpage}%
}
```

`\ForceHTMLTOC` For HTML output, forces the next section to have a TOC entry, even if starred. For use with `\printindex` and others which generate a starred section which should be in the TOC so that it may be accessed via HTML. Not necessary if used with tocbibind. Also see `\ForceHTMLPage`.

For print output, no effect.

```
\newbool{LWR@forcinghtmltoc}

64.2 Book class commands

`\mainmatter` ⚠ Declare the main matter section of the document. Does not reset the page number, which must be consecutive arabic numbers for the HTML conversion.

```
\newbool{LWR@mainmatter}
\DeclareDocumentCommand{\mainmatter}{}{%
\booltrue{LWR@mainmatter}%

```

`\frontmatter` Declare the front matter section of the document, using arabic numbering for the internal numbering. Does not reset the page number.

```
\DeclareDocumentCommand{\frontmatter}{}{%

```

`\backmatter` Declare the back matter section of the document. Does not reset the page number.

```
\DeclareDocumentCommand{\backmatter}{}{%

64.3 Sectioning support macros

`\LWR@sectionumber` {⟨*section type*⟩}

Typeset a section number and its trailing space with CSS formatting:

```
\newcommand*{\LWR@sectionnumber}[1]{%
\InlineClass{sectionnumber}{#1}%
}
```

autosec A tag used by the TOC and index.

\LWR@createautosec {⟨*section type*⟩}

Create an autosection tag.

The use of \textquotedbl instead of " provides improved compatibility with xeCJK.

```
\newcommand*{\LWR@createautosec}[1]{%
\LWR@htmltag{%
    #1 % space
    id=\textquotedbl\LWR@print@mbox{autosec-\arabic{page}}\textquotedbl%
}%
}
```

\LWR@pushoneclose {⟨*sectiontype*⟩} Stacks the new sectioning level's closing tag, to be used when this section is closed some time later.

⚠ \LWR@stoppars must be executed first.

```
\NewDocumentCommand{\LWR@pushoneclose}{m}{%
\LWR@traceinfo{LWR@pushoneclose #1}%
    \LWR@pushclose{#1}%
}
```

\LWR@startnewdepth {⟨*sectiontype*⟩}

Closes currently stacked tags of a lesser level, then opens the new nesting level by saving this new sectioning level's closing tag for later use.

⚠ \LWR@stoppars must be executed first.

```
\NewDocumentCommand{\LWR@startnewdepth}{m}{%
```

Close any stacked sections up to this new one.

```
\LWR@closeprevious{#1}%
```

Push a new section depth:

```
\LWR@pushoneclose{#1}%

Ctr LWR@prevFileDepth Remembers the previous LWR@FileDepth.

Initialized to a deep level so that any section will trigger a new HTML page after the home page.

```
\newcounter{LWR@prevFileDepth}
\setcounter{LWR@prevFileDepth}{\LWR@depthsubparagraph}
```

\@seccntformat {⟨*sectiontype*⟩}

```
\def\@seccntformat#1{\csname the#1\endcsname\quad}
```

\simplechapterdelim Used by tocbibind and anonchap.

```
\newcommand*{\simplechapterdelim}{}
```

\@chapcntformat {⟨*sectiontype*⟩}

\let to \@seccntformat by default, but may be redefined by \simplechapter and \restorechapter from tocbibind or anonchap.

```
\let\@chapcntformat\@seccntformat
```

\@partcntformat {⟨*sectiontype*⟩}

\let to \@seccntformat by default, but may be redefined by ctex.

```
\let\@partcntformat\@seccntformat
```

\@partnameformat Prints "Part" for part sections.

Nullified by ctex.

```
\newcommand*{\@partnameformat}{\LWR@isolate{\partname}~}%
```

\LWR@printchaptername Print \chaptername in most cases, but this is nullified for ctexbook, komascript, ujt* classes.

```
\newcommand*{\LWR@printchaptername}{%
    \ifdefvoid{\chaptername}{}{\chaptername~}%

```

\LWR@section * [⟨*TOC name*⟩] {⟨*name*⟩} {⟨*sectiontype*⟩}

The common actions for the high-level sectioning commands.

```
\DeclareDocumentCommand{\LWR@section}{m m m m}{%

Print an opening comment with the level and the name; ex: "section" "Introduction" Footnotes may be used in section names, which would also appear in the HTML section opening comments, so the short TOC entry is used if possible, and a limited opening comment is made if the sectional unit is starred.

Check if starred:

```
\IfBooleanTF{#1}%
{%

```
    \LWR@traceinfo{LWR@section: starred}%

Starred, but also forcing a TOC entry, so add unnumbered TOC name or regular name:

```

    {%
        \addcontentsline{toc}{#4}{%
            \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}%
        }%
    }%
    {}%
}% starred
```

Not starred, so step counter and add to TOC:

```
{% not starred
```

Only add a numbered TOC entry if section number is not too deep:

```
    \ifthenelse{%
        \cnttest{\@nameuse{LWR@depth#4}}{<=}{\value{secnumdepth}}%
    }%
    {% if secnumdepth

                }%
            }%
            \LWR@traceinfo{LWR@section: finished addcontentsline}%
        }% end of if main matter
```

If not main matter, add unnumbered TOC name or regular name:

```
        {% not main matter
            \LWR@traceinfo{LWR@section: no main matter}%
            \addcontentsline{toc}{#4}{%

```

```
            }%
        }% end of not main matter
    }% end of secnumdepth
```

Deeper than secnumdepth, so add an unnumbered TOC entry:

```
    {%

            \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}%

Print the section name:

Close the heading tag, such as /H2:

```
\LWR@traceinfo{LWR@section: about to close the heading tag}%
\LWR@htmltag{\@nameuse{LWR@tag#4end}}%
\LWR@orignewline%
```

Generate a LaTeX label.

Track the PDF page numbers of the HTML output. A new autopage label may be generated for LWR@currentautosecpage for the start of the section, and also for the current page if it is different due to an SVG image in the section name. Also, the final page after the section has been created is updated in LWR@currentautosecfloatpage.

```
\LWR@traceinfo{LWR@section: about to create the LaTeX label}%
\setcounter{LWR@currentautosecfloatpage}{\value{page}}%
\LWR@newautopagelabel{LWR@currentautosecpage}\LWR@orignewline%
```

If this is the first section found in this file, create a label for prevous/next links:

```
\ifbool{LWR@setseqfilelabel}{}{%
    \label{\BaseJobname-autofile-\arabic{LWR@htmlseqfilenumber}}%
    \booltrue{LWR@setseqfilelabel}%
}%
```

Start paragraph handing unless is an inline paragraph or subparagraph:

```
\ifthenelse{%
    \cnttest{\@nameuse{LWR@depth#4}}{<}{\LWR@depthparagraph}%
}%
    {\LWR@startpars}%
    {}%
```

If not starred, remember the previous depth to possibly trigger a new HTML page.

HOWEVER, allow a \part* to start a new HTML page. This is used by appendix.

A starred section does not trigger a new HTML page at the beginning of this macro, so it should not affect it here at the end either. This became an issue when a \listoftables was tested in the middle of the document. The \chapter* for the list was not allowing a new HTML page for the section following it while CombineHigherDepths was true.

```
\ifthenelse{%
    \NOT\equal{#1}{\BooleanTrue}\OR%
    \cnttest{\@nameuse{LWR@depth#4}}{=}{\LWR@depthpart}%
}%
    {% not starred
        \setcounter{LWR@prevFileDepth}{\@nameuse{LWR@depth#4}}%
    }% not starred
    {}%

Reset to defaults if not a phantomsection:

```
\ifstrempty{#3}%
    {}%
    {%
        \global\boolfalse{LWR@forcinghtmlpage}%
        \global\boolfalse{LWR@forcinghtmltoc}%
    }%
%
\LWR@traceinfo{LWR@section: done}%

69 Title page

package support
⚠ load order

lwarp supports the native LaTeX titling commands, and also supports the packages authblk and titling. If both are used, authblk should be loaded before titling.

\published and \subtitle

If using the titling package, additional titlepage fields for \published and \subtitle may be added by using \AddSubtitlePublished in the preamble. See section 69.8.

affiliation

lwarp provides for the \author macro an additional \affiliation macro to pro-

vide an affiliation and other additional information for each author in the title page. The affiliation information is removed when using titlingpage's `\theauthor` in the main text.

reusing titlepage information

The titling package maintains the definitions of `\thetitle`, `\theauthor`, etc., after the title has been typeset. These commands are to be used to refer to the document's title and author, etc., in the main text. These definitions have the `\thanks` and `\affiliation` removed, and for `\author` the `\and` is replaced to generate a simple inline list of authors separated by commas. Note: `\theauthor` does not work well with authblk unless the traditional LaTeX syntax is used.

⚠ `\theauthor`, authblk

custom titlepages

`\printtitle`, `\printauthor`, etc., are provided for use inside a custom `titlepage` or `titlingpage` environment, and these retain the `\thanks` and `\affiliation`.

`\printthanks`

`\printthanks` has been added to force the printing of thanks inside a `titlingpage` environment when `\maketitle` is not used.

⚠ `\thanks`

Inside a `\titlepage` or `\titlingpage` environment, use `\thanks` instead of `\footnote` for acknowledgements, etc.

69.1 Setting the title, etc.

The following provide setting commands for both HTML and print outputs.

`\author`
`\and`

{⟨*author*⟩} While using `\maketitle` and print mode, the author is treated as a single-column `tabular` and the `\and` feature finishes the current `tabular` then starts a new one for the next author. Each author thus is placed into its own `tabular`, and an affiliation may be placed on its own line such as

```
\author{Name \\ Affiliation \and Second Name \\ Second Affiliation}
```

For HTML, the entire author block is placed inside a `<div>` of class `author`, and each individual author is inside a `<div>` of class `oneauthor`.

`\@title`
`\@author`
`\@date`

`\@title`, `\@author`, and `\@date` store the values as originally assigned, including any `\thanks`, `\and`, or `\affiliation`. These are low-level macros intended to be used by other macros only inside a `titlepage` or `titlingpage`, and are used by `\maketitle`. The author is printed inside a single-column `tabular`, which becomes multiple single-column `tabulars` if multiples authors are included. For HTML, these `tabulars` become side-by-side `<div>`s of class `oneauthor`, all of which are combined into one `<div>` of class `author`.

`\printtitle`
`\printauthor`
`\printdate`

`\printtitle`, etc. are user-level macros intended to be used in custom `titlepage` or `titlingpage` environments in cases where `\maketitle` is not desired. These commands preserve the `\thanks`, etc., and should not be used in the main text.

`\thetitle`
`\theauthor`
`\thedate`
`\HTMLPageBottom`

`\thetitle`, `\theauthor`, and `\thedate` are available if titling has been loaded, and are sanitized user-level versions from which have been removed the `\thanks` and `\affiliation`, and `\and` is changed for inline text usage. The author is printed inline without `\affiliation` or `\thanks`, with `\and` placing commas between multiple authors. Thus, these commands are to be used in the main text whenever the user wishes to refer to the document's title and such. One practical use for this is to place the authors at the bottom of each HTML page, such as:

```
\HTMLPageBottom{
  \begin{center}\textcopyright~20xx \theauthor\end{center}
```

```
}
```

⚠ \theauthor, authblk

\theauthor does not work well if authblk is used. If \theauthor is important, it is recommended to use the standard LaTeX syntax for \author, optionally with lwarp's \affiliation macro as well.

⚠ affiliations

After \maketitle has completed, \theauthor retains the definition of the author, but \and is changed to become a comma and a space, intending to print the authors names separated by spaces. This fails when affiliations are included on their own table rows.

\affiliation

A solution, provide here, is to define a macro \affiliation which, during \maketitle, starts a new row and adds the affiliation, but after \maketitle is finished \affiliation is re-defined to discard its argument, thus printing only the author names when \author is later used inline.

69.2 \if@titlepage

for HTML & PRINT:

```
\begin{warpall}
```

\if@titlepage

Some classes do not provide \if@titlepage. In this case, provide it and force it false.

```
\ifcsvoid{@titlepagefalse}{
    \newif\if@titlepage
    \@titlepagefalse
}{}

\end{warpall}
```

69.3 Changes for \affiliation

\affiliation {⟨*text*⟩}

Adds the affiliation to the author for use in \maketitle.

Inside titlepage, this macro prints its argument. Outside, it is null.

for HTML & PRINT:

```
\begin{warpall}
\providerobustcmd{\affiliation}[1]{}
\end{warpall}
```

for PRINT output:

```
\begin{warpprint}

\AtBeginEnvironment{titlepage}{
\renewrobustcmd{\affiliation}[1]{\\ \textsc{\small#1}}
}

\AtBeginDocument{
\IfPackageLoadedTF{titling}{
\AtBeginEnvironment{titlingpage}{
\renewrobustcmd{\affiliation}[1]{\\ \textsc{\small#1}}
}
```

```
}{}% titling loaded
}% AtBeginDocument
```

```
\end{warpprint}
```

for HTML output:

```
\begin{warpHTML}
```

Env `titlepage` Sets up a of class `titlepage`. Provided even for memoir class, since it is used by `\maketitle`.

```
\DeclareDocumentEnvironment{titlepage}{}
{%
    \renewrobustcmd{\affiliation}[1]{\\ \InlineClass{affiliation}{##1}}%
    \LWR@printpendingfootnotes
    \LWR@forcenewpage
    \BlockClass{titlepage}
}
{
    \endBlockClass
    \LWR@printpendingfootnotes
}
```

```
\end{warpHTML}
```

69.4 Printing the thanks

`\printthanks` Forces the `\thanks` to be printed. This is necessary in a `titlingpage` environment when `\maketitle` was not used.

for PRINT output:

```
\begin{warpprint}
\newcommand*{\printthanks}{\@thanks}
\end{warpprint}
```

for HTML output:

```
\begin{warpHTML}
\newcommand*{\printthanks}{\LWR@stoppars\@thanks\LWR@startpars}
\end{warpHTML}
```

69.5 Printing the title, etc. in HTML

The following are for printing the title, etc. in a `titlepage` or a `titlingpage` in HTML:

for HTML output:

```
\begin{warpHTML}
```

`\printtitle`

```
\newcommand*{\printtitle}

    \@title%
    \LWR@htmltag{\LWR@tagtitleend}%

}
```

\LWR@printthetitle A private version which prints the title without footnotes, used to title each HTML page.

```
\newcommand*{\LWR@printthetitle}

```

\printauthor HTML version.

```
\newcommand*{\printauthor}{
```

The entire author block is contained in a named author:

```
\begin{BlockClass}{author}
```

}
```

Individual authors are contained in a named oneauthor:

```
\begin{BlockClass}{oneauthor}

\end{BlockClass}
\end{BlockClass}
}
```

\printdate

```
\newcommand*{\printdate}{%
\begin{BlockClass}{titledate}

\end{BlockClass}
}
```

```
\end{warpHTML}
```

69.6 Printing the title, etc. in print form

The following are for printing the title, etc. in a titlepage or a titlingpage in print form:

for PRINT output:

```
\begin{warpprint}
```

\printtitle

```
\newcommand*{\printtitle}{{\Huge\@title}}
```

69.7 \maketitle for HTML output

An HTML of class titlepage is used.

\thanks are a form of footnotes used in the title page. See section 60 for other kinds of footnotes.

See \thanksmarkseries{series}, below, to set the style of the footnote marks.

for HTML output:

```
\begin{warpHTML}

\maketitle HTML mode. Creates an HTML titlepage div and typesets the title, etc.

Code from the titling package is adapted, simplified, and modified for HTML output.

The name \LWR@maketitle is used to preserve its definition in case a later package overwrites \maketitle.

```
\newcommand*{\LWR@maketitle}{%

69.8 \published and \subtitle

\subtitle and \published

To add \subtitle and \published to the titlepage, load the titling package and use \AddSubtitlePublished in the preamble.

The default lwarp.css has definitions for the published and subtitle classes.

If titling is loaded, \AddSubtitlePublished creates a number of additional macros, and also assigns some of the titling hooks. If titling is not loaded, \AddSubtitlePublished creates null macros.

⚠ titling hooks

Do not use \AddSubtitlePublished if the user has patched the titling hooks for some other reason. Portions are marked \warpprintonly to reduce extra tags in HTML. Similarly, BlockClass has no effect in print mode. Thus, the following may be marked warpall.

for HTML & PRINT:

```
\begin{warpall}
```

\AddSubtitlePublished

Adds \published and \subtitle, and related.

```
\newcommand*{\AddSubtitlePublished}{%
\IfPackageLoadedTF{titling}{% yes titling package

70 Abstract

The following code replaces the LaTeX default, and will itself be replaced later if the abstract package is loaded.

for HTML output:

```
\begin{warpHTML}
```

`\abstractname` User-redefinable title for the abstract.

Also over-written by the babel package.

```
\providecommand*{\abstractname}{Abstract}
```

Some classes allow an optional name, so it is allowed here.

Env `abstract`

```
\DeclareDocumentEnvironment{abstract}{O{\abstractname}}

    \LWR@forcenewpage
    \BlockClass{abstract}
    \BlockClassSingle{abstracttitle}{#1}
}
{
    \endBlockClass
}

\end{warpHTML}
```

71 Quote and verse

71.1 Attributions

`\attribution` {⟨*name*⟩}

For use with quote, quotation, verse:

Ex: `"A quotation." \attribution{\textsc{Author Name}\\\textsl{Book Title}}`

for HTML & PRINT:

```
\begin{warpall}
\newcommand{\attribution}[1]{
    \begin{flushright}
    \unskip
    #1
    \end{flushright}%
}
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}
\newcommand{\LWR@HTML@attribution}[1]{%

```

71.2 Quotes, quotations

for HTML output:

```
\begin{warpHTML}
```

Env `quote`

```
\newenvironment*{LWR@HTML@quote}

}
{\LWR@htmlblocktag{/blockquote}}

\LWR@formattedenv{quotation}

\end{warpHTML}
```

71.3 Verse

When using verse or memoir, always place a \\ after each line.

\attrib

The documentation for the verse and memoir packages suggest defining an \attrib command, which may already exist in current documents, but it will only work for print output. lwarp provides \attribution, which works for both print and HTML output. To combine the two so that \attrib is used for print and \attribution is used for HTML:

```
\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}
```

Len \vleftskip
Len \vleftmargini
Len \HTMLvleftskip
Len \HTMLleftmargini

These lengths are used by verse and memoir to control the left margin, and they may already be set by the user for print output. New lengths \HTMLvleftskip and \HTMLleftmargini are provided to control the margins in HTML output. These new lengths may be set by the user before any verse environment, and persist until they are manually changed again. One reason to change \HTMLleftmargini is if there is a wide \flagverse in use, such as the word "Chorus", in which case the value of \HTMLleftmargini should be set to a wide enough length to contain "Chorus". The default is wide enough for a stanza number.

⚠ spacing

Horizontal spacing relies on *pdftotext*'s ability to discern the layout (-layout option) of the text in the HTML-tagged PDF output. For some settings of \HTMLleftmargini or \HTMLleftskip the horizontal alignment may not work out exactly, in which case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

⚠ verse margin

71.3.1 LaTeX core verse environment

for HTML output:

```
\begin{warpHTML}
```

Env verse

```
\newenvironment{LWR@HTML@verse}

                        \listparindent\itemindent
                        \rightmargin  \leftmargin
                        \advance\leftmargin 1.5em}%
                \item\relax}
               {\endlist}

```
\end{warpHTML}
```

for HTML & PRINT:

```
\begin{warpall}

71.3.2 verse and memoir

The following lengths are used by verse and memoir. They may be set in either print or HTML output, but are only used in HTML. This allows the user to set \vleftskip and \leftmargini for print output, and optionally select different values for HTML.

Len \HTMLvleftskip Sets \vleftskip inside a verse environment in HTML.

```
\newlength{\HTMLvleftskip}
\setlength{\HTMLvleftskip}{1em}
```

Len \HTMLleftmargini Sets \leftmargini inside a verse environment in HTML.

```

74 Lists

The environments `itemize`, `enumerate`, and `description` are patched when lwarp is started. These patches support the standard LaTeX environments, as well as those of enumerate, enumitem, and paralist, and at least the French version of babel. Additional patches are done on a package-specific basis.

The LaTeX source for `itemize` and `enumerate` are found in `source2e`, but the source for `description` is found in `article.cls`, etc.

empty item To have an empty item,use `\mbox{}` or a trailing backslash. This forces a new line in print output, matching the new line which will appear in HTML output. Ex:

```
begin{itemize}
item \mbox{}
    \begin{itemize}
...
    \end{itemize}
item \
```

```
  \begin{itemize}
...
  \end{itemize}
```

\makelabel

While inside a list environment, lwarp nullifies a number of TEX horizontal skip and fill commands, allowing the user to define \makelabel for print mode while HTML mode ignores those commands.

⚠ label font When defining \makelabel in a list environment, use \textbf etc. instead of \bfseries.

74.2 Itemize

`\LWR@itemizeitem` `[`⟨*label*⟩`]`

Handles `\item` inside an itemize or enumerate.

The optional argument is passed to `\LWR@origitem`.

See `\LWR@openparagraph` where extra `\hspace` is used to leave room for the label while inside a list during paragraph construction.

```

74.4 Description

`\LWR@descitem` [⟨*label*⟩] Handles an `\item` inside a description.

```
\newcommand*{\LWR@descitem}[1][]{%
    \LWR@stoppars%
    \LWR@setlatestname{#1}%
    \LWR@startnewdepth{descitem}%

```

Env `description` [⟨*options*⟩]

Footnotes are modified to correctly parse optional arguments.

```
\newcommand*{\LWR@descriptionstart}{%

```

74.5 Patching the lists

\LWR@patchlists Patches list environments.

\LWR@patchlists remembers \item as defined by whatever packages have been loaded, then patches the itemize, enumerate, and description environments and \item. This works with the native LaTeX environments, as well as those provided by enumitem, enumerate, and paralist.

```

75 Tabular

This is arguably the most complicated part of the entire package. Numerous tricks are employed to handle the syntax of the LaTeX core and the various tabular-related packages.

75.1 Limitations

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, multirows, siunitx S columns, or the packages multirow, longtable, supertabular, or xtab.

Defining macros and environments:

⚠ Misplaced alignment tab character &

- When defining environments or macros which include `tabular` and instances of the `&` character, it may be necessary to make `&` active before the environment or macro is defined, then restore `&` to its default catcode after, using the following commands. These are are ignored in print mode.

```
\StartDefiningTabulars
<define macros or environments using tabular and &
here>
\StopDefiningTabulars
```

⚠ floatrow

This includes before and after defining any macro which used `\ttabbox` from floatrow.

⚠ `tabular` inside another environment

- When creating a new environment which contains a `tabular` environment, lwarp's emulation of the tabular does not automatically resume when the containing enviroment ends, resulting in corrupted HTML rows. To fix this, use `\ResumeTabular` as follows. This is ignored in print mode.

```
\StartDefiningTabulars  %    (&  is  used  in  a
definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars
```

For developers:

- To automate the use of `\StartDefiningTabulars` and `\EndDefiningTabulars`, these macros may be embedded inside an HTML environment definition to automatically change the catcode of `&` before absorbing the arguments. Another environment may be embedded as well.

```
% Does the work after the catcode has been changed:
\newcommand*{\LWR@HTML@subsomename}[2]{%
  . . .
  \otherenvironmentname  [<args>]  {<args>}  %  for
example
}
% Change catcode before absorbing arguments:
\newcommand*{\LWR@HTML@somename{%
  \StartDefiningTabulars
  \LWR@HTML@subsomename
}
% Change catcode again at the end:
\newcommand*{\LWR@HTML@endsomename}{%
  . . .
  \endotherenvironmentname   % for example
  \StopDefiningTabulars
}
% Combine with the existing print definition:
\LWR@formattedenv{somename}
```

Cell contents:

⚠ macro in a table

- Using a custom macro inside a tabular data cell may result in an extra HTML data cell tag, corrupting the HTML table. To avoid this, use `\TabularMacro` just before the macro. This is ignored in print mode.

```
\TabularMacro\somemacro & more row contents \\
```

Column specifiers:

⚠ math

- Due to the way math is gathered for processing, column specifiers such as `>{$}c<{$}` do not work with lwarp. Instead, each cell must specify math mode individually.

`@` and `!`

- Only one each of `@` and `!` is used at each column, and they are used in that order.

`\multirow`

- In `\multirow` cells, the print version may have extra instances of <, >, `@`, and `!` cells on the second and later rows in the `\multirow` which do not appear in the HTML version.

⚠ `\newcolumntype`

- If `\newcolumntype` does not work for HTML, add a simplified column type using `\HTMLnewcolumntype`.

font and alignment

- lwarp detects each of the following, and sets HTML CSS appropriately:

```
>{\centering\arraybackslash}
>{\raggedright\arraybackslash}
>{\raggedleft\arraybackslash}
>{\itshape}
>{\bfseries}
>{\bfseries\itshape}
```

  These may be used with `\newcolumntype`, such as:

```
\newcolumntype{P}[1]{>{\centering\arraybackslash}p{#1}}
```

Rules:

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.

vertical rules

- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

width and trim

- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with `@` or `!` columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

combined rules

- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:
  ```
  \cmidrule{2-3} \\[-2ex]
  \bottomrule
  ```
  The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

⚠ `\warpprintonly`
⚠ Misplaced `\noalign`

- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warpHTML` environment, if a "Misplaced `\noalign`" error occurs, change
  ```
  This & That \endhead
  ```
  to
  ```
  \warpprintonly{This & That \endhead}
  ```
  and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevent to HTML output.

Other:

- tabularx ignores the width, but `X` columns do produce paragraph columns or multicolumns.

`longtable` headings

- For longtable, place headings and footings which do not apply to HTML inside `\warpprintonly{}`.

⚠ S columns

- For S columns (from the siunitx package), while producing print output, anything non-numeric must be placed inside { } braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by lwarp's tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:
  ```
  \warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
  \warpHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
  ```

⚠ `tabular` inside a `<span>`

- In LaTeX, a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

for HTML output: 8734 `\begin{warpHTML}`

75.2 Temporary package-related macros

These macros are temporary placeholders for macros defined by various packages. If the relevent package is not loaded, these placeholders are used instead.

75.2.1 arydshln

Emualated by the original LaTeX non-dashed versions.

```
\LetLtxMacro\hdashline\hline
\LetLtxMacro\cdashline\cline
\LetLtxMacro\firsthdashline\hline
\LetLtxMacro\lasthdashline\hline
```

75.3 Token lookahead

Used by `\LWR@futurenonspacelet` to look at the next token.

`\LWR@mynexttoken`

```
\newcommand\LWR@mynexttoken\relax
```

`\LWR@futurenonspacelet` `\futurelet` copies the next token then executes a function to analyze it.

`\LWR@futurenonspacelet` does the same, but ignores intervening spaces and paragraphs.

Based on the booktabs style:

```
\def\LWR@futurenonspacelet#1{\def\LWR@cs{#1}%
\afterassignment\LWR@fnslone\let\nexttoken= }

\def\LWR@fnslone{\expandafter\futurelet\LWR@cs\LWR@fnsltwo}

\def\LWR@fnsltwo{%
    \expandafter\ifx\LWR@cs\@sptoken%
        \let\next=\LWR@fnslthree%
    \else%
        \expandafter\ifx\LWR@cs\par%
            \let\next=\LWR@fnslthree%
        \else%
            \let\next=\nexttoken%
        \fi%
    \fi\next}

\def\LWR@fnslthree{\afterassignment\LWR@fnslone\let\next= }
```

`\LWR@getmynexttoken` Looks ahead and copies the next token into `\LWR@mynexttoken`.

```
\newcommand*{\LWR@getmynexttoken}{%
    \LWR@traceinfo{LWR@getmynexttoken}%
```

⚠ Nothing must follow this next line:

```
    \LWR@futurenonspacelet\LWR@mynexttoken\LWR@tabledatacolumntag
}
```

75.4 Tabular variables

In order to support nested `tabular`s, each of these is used locally. For local counters, etoolbox's `\defcounter` and lwarp's new `\defaddtocounter` are used.

Bool `LWR@startedrow` True if should print a row tag before this column.

```
\newbool{LWR@startedrow}
\boolfalse{LWR@startedrow}
```

Bool `LWR@tabularcelladded` True if have added a data cell for this position.

```
\newbool{LWR@tabularcelladded}
\boolfalse{LWR@tabularcelladded}
```

Ctr `LWR@hlines` Number of `\hlines` or `\midrules` above the next row.

```
\newcounter{LWR@hlines}
```

Ctr `LWR@hdashedlines` Number of arydshln dashed lines above the next row.

```
\newcounter{LWR@hdashedlines}
```

Bool `LWR@doingtbrule` True if the next row will have a top/bottom rule above it.

```
\newbool{LWR@doingtbrule}
\boolfalse{LWR@doingtbrule}
```

Bool `LWR@doingcmidrule` True if the next row will have a cmidrule above it.

This is used by `\LWR@tabularfinishrow` to force a final empty row to create the border for the `\cmidrule`.

```
\newbool{LWR@doingcmidrule}
\boolfalse{LWR@doingcmidrule}
```

Bool `LWR@tableparcell` True if are handling a paragraph inside a table cell, so must close the paragraph tag before moving on.

```
\newbool{LWR@tableparcell}
```

Bool `LWR@skippingmrowcell` True if are doing an empty `\multirow` cell, and thus there is no data tag to close.

```
\newbool{LWR@skippingmrowcell}
```

Bool `LWR@skippingmcolrowcell` True if are doing an empty `\multicolumnrow` cell, and thus there is no data tag to close, and do not print `@` and `!` columns.

```
\newbool{LWR@skippingmcolrowcell}
```

Bool `LWR@usedmultirow` Used to error if used `\multirow` or `\multicolumnrow` without using `\mrowcell` or `\mcolrowcell`.

```
\newbool{LWR@usedmultirow}
```

Bool `LWR@foundmrowcell` Used to error if used `\multirow` or `\multicolumnrow` without using `\mrowcell` or `\mcolrowcell`.

```
\newbool{LWR@foundmrowcell}
```

Bool `LWR@skipatbang` True if just finished a `\multicolumn` so should not create the trailing `@` or `!` columns table data cells.

```
\newbool{LWR@skipatbang}
```

Bool LWR@emptyatbang — True if finishing a row and should print empty @ or ! column table data cells.

```
\newbool{LWR@emptyatbang}
```

Bool LWR@intabularmetadata — True if are in a tabular but not in a data cell. Used to prevent extra HTML breaks if not inside table data.

```
\newbool{LWR@intabularmetadata}
\boolfalse{LWR@intabularmetadata}
```

Bool LWR@exitingtabular — When \end is found, turns off the next opening data tag.

```
\newbool{LWR@exitingtabular}
```

Bool LWR@tabularmutemods — Mutes HTML output for @, !, < and >.

This is used while printing the final row to generate \bottomrules.

```
\newbool{LWR@tabularmutemods}
```

Bool LWR@validtablecol — True if found a valid table column type.

```
\newbool{LWR@validtablecol}
```

Bool LWR@opttablecol — True if found a table column optional argument.

```
\newbool{LWR@opttablecol}
```

Used to add a style to a table data cell:

```
\newbool{LWR@tdhavecellstyle}
```

Ctr LWR@tabularDepth — Tracks whether & is being used inside a tabular.

```
\newcounter{LWR@tabulardepth}
\setcounter{LWR@tabulardepth}{0}
```

Ctr LWR@tabularpardepth — Tracks whether should look ahead at the next token when encountering a \par while processing tabular contents.

When LWR@tabularpardepth is deeper than LWR@tabulardepth then lwarp has started looking at the contents of the tabular, and thus any \pars encountered must be followed by another token lookahead.

```
\newcounter{LWR@tabularpardepth}
\setcounter{LWR@tabularpardepth}{0}
```

```
\newcommand*{\LWR@colsresult}{}%temp storage for column format results
\newcommand*{\LWR@pposition}{}
\newcommand*{\LWR@pleft}{}
\newcommand*{\LWR@pright}{}
```

LWR@tablecolspec — Holds the parsed column specification, of total width LWR@tabletotalLaTeXcols, not counting @ and ! columns.

Will contain a string such as llrrccpc, exactly one letter per LaTeX table column, without @, !, >, <, or the vertical bar.

\LWR@strresult Holds the result of Str functions.

```
\providecommand*{\LWR@strresult}{}
\providecommand*{\LWR@strresulttwo}{}
```

\LWR@origcolspec Holds the original column specs given to tabular.

```
\newcommand*{\LWR@origcolspec}{}
```

Ctr LWR@tablecolspecwidth Holds the number of tokens in the table columns specification.

This is includes one for each @, !, <, > column, and also one for each of the parameters of p, @, !, <, > columns, and three for each D column.

(This is not the total # of LaTeX columns in the table.)

```
\newcounter{LWR@tablecolspecwidth}
```

Ctr LWR@tablecolspecindex While parsing the LaTeX table column specification, starts at 1 and is incremented per token of the specification.

```
\newcounter{LWR@tablecolspecindex}
```

Ctr LWR@tableLaTeXcolindex While producing the table, resets to 1 at the start of the table and also at each end of line, and is incremented by 1 by each ampersand.

```
\newcounter{LWR@tableLaTeXcolindex}
```

Ctr LWR@tabletotalLaTeXcols While parsing a table column specification, begins at 0 and increments by 1 per LaTeX table column. Eventually holds the final number of LaTeX table columns in each row, not counting @ and ! columns. (In HTML, @ and ! cells become their own columns, but are not included in LWR@tabletotalLaTeXcols.)

```
\newcounter{LWR@tabletotalLaTeXcols}
```

Ctr LWR@tabletotalLaTeXcolsnext Holds the next LaTeX table column index while parsing, equal to one more than LWR@tabletotalLaTeXcols.

```
\newcounter{LWR@tabletotalLaTeXcolsnext}
```

LWR@colatspec A data array of specifications for @ columns. The leftmost's index is leftedge, the others are counter values. See section 42.

LWR@colbangspec A data array of specifications for ! columns. The leftmost's index is leftedge, the others are counter values. See section 42.

LWR@colbeforespec A data array of specifications for > columns.

LWR@colafterspec A data array of specifications for < columns.

LWR@colbarspec A data array of specifications for vertical rules.

LWR@coladdclass A data array of extra css class, as set by >.

Ctr LWR@cellcolordepth Counts how many cell color s were added to the current tabular data cell.

```
\newcounter{LWR@cellcolordepth}
```

75.4.1 Multicolumn variables

```
\newcounter{LWR@tablemulticolswidth}
```

Indexes into the multicolumn specification:

```
\newcounter{LWR@tablemulticolspos}
```

Remembers multicolumn vertical rules if found in the column spec.

```
\newcounter{LWR@mcolvertbarsl}
\newcounter{LWR@mcolvertbarsr}

75.4.2 Longtable variables

Bool `LWR@starredlongtable`

Per the caption package, step the counter if `longtable*`.

```
\newbool{LWR@starredlongtable}
\boolfalse{LWR@starredlongtable}
```

75.4.3 Midrule variables

Ctr `LWR@midrulecounter`

Indexes across the `LWR@midrules` and `LWR@trim<l/r>rules` data arrays.

```
\newcounter{LWR@midrulecounter}
```

75.5.1 Handling &

for HTML output:

```
\begin{warpHTML}
```

& Will behave depending on whether it is being used inside tabular.

& is redefined to test whether it is inside a tabular environment, in which case it performs special processing for HTML conversion. If not, it behaves normally.

```
\newcommand*{\LWR@tabularampersand}{%
    \LWR@traceinfo{LWR@tabularampersand}%
    \ifnumcomp{\value{LWR@tabulardepth}}{>}{0}%
    {%

        \LWR@closetabledatacell%
```

Move to the next column.

```
        \defaddtocounter{LWR@tableLaTeXcolindex}{1}%
```

Have not yet added data in this column:

```
        \global\boolfalse{LWR@tabularcelladded}%
```

Look at the next token to decide multi or single column data tag.

```
        \LWR@getmynexttoken%
    }%
```

If not inside a tabular, performs the original action:

```
    {%
        \LWR@origampmacro%
    }%
}
```

& is left with its original catcode for now.

tikz package seems to require & be left alone until after tikz has been loaded. Also, cleveref uses the ampersand in one of its options.

& is made active inside a tabular.

& is left alone when in math alignments.

75.6 Filling an unfinished row

\LWR@tabularfinishrow Adds empty table cells if necessary to finish the row.

At the end of the table, if any bottom rules are requested then an empty row must be generated to form the borders which show the rules.

```
\newcommand*{\LWR@tabularfinishrow}{%
```

If not exiting the tabular, or doing a rule, or have already started a row, finish this row:

```
    \ifboolexpr{%
        not bool {LWR@exitingtabular} or%
        bool{LWR@doingtbrule} or%
        bool{LWR@doingcmidrule} or%
        test{\ifnumcomp{\value{LWR@hlines}}{>}{0}} or%
        test{\ifnumcomp{\value{LWR@hdashedlines}}{>}{0}} or%
        bool{LWR@startedrow}%
    }{%
```

To temporarily turn off LWR@exitingtabular so that table data tags will still be generated:

If generating a final row for the \bottomrule borders, turn off the @, !, <, and > column output:

```
    \ifbool{LWR@exitingtabular}{%
        \booltrue{LWR@tabularmutemods}%
    }{%
        \boolfalse{LWR@tabularmutemods}%
    }%
```

Locally reenable the table data tags until finished with the final row:

```
    \boolfalse{LWR@exitingtabular}%
```

Generate table data tags and ampersands until the right edge:

```
    \whileboolexpr{%
        test {
            \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
                {\value{LWR@tabletotalLaTeXcols}}
        } or %
        (%
            bool{LWR@intabularmetadata} and%
            not bool{LWR@tabularcelladded} and%
```

```
            test {
                \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{=}
                    {\value{LWR@tabletotalLaTeXcols}}
            }%
        )%
    }%
    {%
        \LWR@tabledatasinglecolumntag%

The following is essentially `\LWR@tabularampersand` with `LWR@emptyatbang` added to empty the following cells:

```
        \LWR@closetabledatacell%
        \defaddtocounter{LWR@tableLaTeXcolindex}{1}%
        \global\boolfalse{LWR@tabularcelladded}%
        \booltrue{LWR@emptyatbang}%
```

Starts the next cell:

```
        \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
                {\value{LWR@tabletotalLaTeXcols}}%
            {\LWR@getmynexttoken}%
            {}%
    }%
```

Reenable the original `LWR@exitingtabular` to close the entire table:

```
    \ifbool{LWR@tabularmutemods}{%
        \booltrue{LWR@exitingtabular}%
    }{%
        \boolfalse{LWR@exitingtabular}%
    }%
    \boolfalse{LWR@tabularmutemods}%

    \boolfalse{LWR@emptyatbang}%
    }{}% ifboolexpr

```

75.7 Handling \\

75.8 Looking ahead in the column specifications

`\LWR@columnspeclookahead` {⟨*offset*⟩}

75.14 Parsing the column specifications

⚠ tabular baselines

HTML CSS cannot exactly match the LaTeX concept of a baseline for a table row. Table 13 shows the LaTeX results for various vertical-alignment choices, with the baseline of the first column drawn across all the columns for comparison. See the p column specification in table 14 for details.

Table 14 describes how each kind of column is converted to HTML.

Table 15 shows the various internal macros generated for each column type.

Table 14: Tabular HTML column conversions

Each cell is given a CSS class of `td<columntype>`.

l, r, c: Converted to table cells without paragraph tags.
Uses CSS `vertical-align:middle` so that top or bottom-aligned cells may go above or below this cell.

p: Converted to table cells with paragraph tags. Ref: Table 13, LaTeX places the top line of a parbox aligned with the rest of the text line, so CSS `vertical-align:bottom` is used to have the HTML result appear with the paragraph extending below the L, R, C cells at the middle, if possible. This may be confusing as a P cell may not top-align with an L,R,C cell in the HTML conversion, especially in the presence of a B cell, and two P cells side-by-side will be aligned at the bottom instead of the top. Some adjustment of the CSS may be desired, changing `td.tdp`, `td.tdP`, `td.tdprule`, and `td.tdPrule` to `vertical-align: middle`. Another possibility is to change L,R,C, and P to `vertical-align: top` and not worry about the alignment of B and M cells or trying to approximate LaTeX baselines.

m: With paragraph tags, CSS `vertical-align:middle`.

b: With paragraph tags, CSS `vertical-align:top` so that the bottom of the text is closest to the middle of the text line.

w and W: Converted to `l`, `c`, or `r`. No paragraph tags.

P, M, B: Horizontally-centered versions.

S: Treated as 'c'. Ignores optional argument. From the siunitx package.

D: Treated as 'c'. From the dcolumn package.

@, !, >, <: One each, in that order.

|: Vertical rule.

Unknown: Converted to 'l'.

`\newcolumntype`: Expands to its replacement text.

`\HTMLnewcolumntype`: Provides simplified replacement text for HTML.

Table 15: HTML column type internal macros

<coltype>: The single-letter column type, such as c or X.

Created by \LWR@modifycolumntype: Used by lwarp to add HTML functionality to each built-in column type.

\LWR@columntype@<coltype>: Handles tabular columns depending on the type. Calls \LWR@parsenormalcolumn or related, then advances \LWR@tablecolspecindex.

\LWR@columntype@mctype@<coltype>: Generates the \multicolumn HTML cell CSS class. Calls \LWR@printmccoltype@normal or related.

\LWR@columntype@mcdata@<coltype>: Generates the \multicolumn HTML cell data. Calls \LWR@printmccoldata@normal or related.

Created by \newcolumntype: From array.

\NC@find@<coltype>: Internally used to parse the column specifier.

\NC@rewrite@<coltype>: Stores the print-mode replacement text.

Created by \HTMLnewcolumntype: From lwarp.

\LWR@print@NC@rewrite@<coltype>: Copied from \NC@rewrite@<type>.

\LWR@HTML@NC@rewrite@<coltype>: Stores the HTML-mode replacement text.

\NC@rewrite@<coltype>: Redefined to use the print or HTML version.

\LWR@parsetablecols {⟨*colspecs*⟩}

Scans the column specification left to right.

Builds \LWR@tablecolspec with the final specification, one LaTeX column per entry. The final number of LaTeX columns in each row is stored in LWR@tabletotalLaTeXcols, which is the number of & and \\ in each line, but which does not include @, !, <, > specifications in the count.

```
\newcommand*{\LWR@parsetablecols}[1]{%

Remove spaces:

```

Expand any star columns:

Place the colspecs string length into \LWR@strresult, and remember the number of characters in the column specification:

```

    \defcounter{LWR@tablecolspecwidth}{\LWR@strresult}%
```

Haven't seen any optional arguments so far

```
    \boolfalse{LWR@opttablecol}%

                {\value{LWR@tablecolspecwidth}}%
        }%
    }%
    {%
```

Place the next single-character column type into \LWR@strresult:

```
    \expandarg%
   \StrChar{\LWR@origcolspec}{\arabic{LWR@tablecolspecindex}}[\LWR@strresult]%
   \LWR@traceinfo{position \arabic{LWR@tablecolspecindex}: \LWR@strresult}%
    \fullexpandarg%
```

Not yet found a valid column type:

```
    \boolfalse{LWR@validtablecol}%
```

Skip over any optional arguments, such as siunitx S column:

```
    \IfStrEq{\LWR@strresult}{[}{\booltrue{LWR@opttablecol}}{}%
```

Throw away anything found inside the optional argument:

```
    \ifbool{LWR@opttablecol}%
    {}% inside an optional argument
    {% not an optional tabular argument
```

Not inside an optional argument, so consider the column type:

```
        \ifcsdef{LWR@columntype@\LWR@strresult}%
            {\csuse{LWR@columntype@\LWR@strresult}}%
            {}%
```

If an unknown column type, use l:

```
        \ifbool{LWR@validtablecol}{}{%
            \LWR@traceinfo{invalid column type: \LWR@strresult}%
            \LWR@parsenormalcolumn{l}%
        }%
    }% not an optional column argument
```

If read the closing bracket, no longer inside the optional argument:

```
    \IfStrEq{\LWR@strresult}{]}{\boolfalse{LWR@opttablecol}}{}%
```

Move to the next character:

```
    \defaddtocounter{LWR@tablecolspecindex}{1}%
    }% whiledo
}%
```

75.20 Midrules

LWR@midrules LWR@midrules is a data array (section 42) of columns each containing a non-zero width if a midrule should be created for this column.

LWR@trimlrules LWR@trimlrules is a data array (section 42) of columns containing l if a midrule should be left trimmed for each column.

LWR@trimrrules LWR@trimrrules is a data array (section 42) of columns containing r if a midrule should be right trimmed for each column.

LWR@cdashlines LWR@cdashlines is a data array (section 42) of columns each containing a Y if an arydshln package "cdashed line" should be created for this column.

Len \LWR@heavyrulewidth The default width of the rule.

```
\newlength{\LWR@heavyrulewidth}

75.22 Multicolumns

75.22.1 Parsing multicolumns

\LWR@printmccoltype@normal {⟨*col type*⟩}

Prints the column type, and remembers that any vertical bars are no longer on the left edge.

```
\newcommand*{\LWR@printmccoltype@normal}[1]{%
    #1%
    \boolfalse{LWR@mcolvertbaronleft}%
}
```

\LWR@printmccoltype@ignore {⟨*col type*⟩}

This type does not print a multi-column data cell.

```
\newcommand*{\LWR@printmccoltype@ignore}[1]{}%
```

\LWR@printmccoltype@vertbar {⟨*col type*⟩}

Adds a left or right vertical bar.

```
\newcommand*{\LWR@printmccoltype@vertbar}[1]{%
    \ifbool{LWR@mcolvertbaronleft}%
        {\defaddtocounter{LWR@mcolvertbarsl}{1}}% left edge
        {\defaddtocounter{LWR@mcolvertbarsr}{1}}% not left edge
}
```

`\LWR@printmccoltype@colon` {⟨*col type*⟩}

Adds a left or right vertical bar.

`\LWR@printmccoltype@semicolon` {⟨*col type*⟩}

Adds a left or right vertical bar.

```
\let\LWR@printmccoltype@semicolon\LWR@printmccoltype@colon
```

`\LWR@printmccoltype` {⟨*colspec*⟩} Print any valid column type found. Does not print `@`, `!`, `>`, or `<` columns or their associated tokens.

This is printed as part of the table data tag's `class`.

`\LWR@columntype@mctype@<type>` is defined by `\LWR@modifycolumntype`.

```
\newcommand*{\LWR@printmccoltype}[1]{%

Get one token of the column spec:

```

Detokenize to avoid problems with special characters:

```
    \edef\LWR@strresult{\detokenize\expandafter{\LWR@strresult}}%

Add to the HTML tag depending on which column type is found:

```
    \ifcsdef{LWR@columntype@mctype@\LWR@strresult}%

        {\boolfalse{LWR@mcolvertbaronleft}}%
    \LWR@traceinfo{lwr@printmccoltype done}%
}
```

`\LWR@printmccoldata@other` {⟨*num args to skip*⟩} {⟨*entire colspec*⟩}

For `@`, `!`, `>`, `<`, print the next token without paragraph tags:

```
\newcommand*{\LWR@printmccoldata@other}[2]{%
    \defaddtocounter{LWR@tablemulticolspos}{1}%
    \StrChar{#2}{\arabic{LWR@tablemulticolspos}}[\LWR@strresult]%

`\LWR@printmccoldata@skip` {⟨*num args to skip*⟩} {⟨*entire colspec*⟩}

Nothing to print for this column type.

```
\newcommand*{\LWR@printmccoldata@skip}[2]{%

A valid column data type was found:

For `\LWR@printmccoldata@...>`, {⟨*num args to skip*⟩} is provided by `\LWR@columntype@mcdata@<coltype>` when it was defined by `\LWR@modifycolumntype`. `\entire colspec` is provided by `\LWR@printmccoldata` when it uses `\LWR@columntype@mcdata@<coltype>`.

\parsemulticolumnalignment {⟨*1: colspec*⟩} {⟨*2: printresults csname*⟩}

Scan the multicolumn specification and execute the printfunction for each entry.

Execute the assigned print function for each token in the column spec:

```
        \csuse{#2}{#1}%

Move to the next token in the column spec:

```

if the optional caption was given, but empty, do not form a TOC entry

If the optional caption was given, but might only be `[]`:

```

The optional caption is `[]`:

75.22.5 Counting HTML tabular columns

The LaTeX specification for a table includes a number of columns separated by the `&` character. These columns differ in content from line to line. Additional virtual columns may be specified by the special `@` and `!` columns. These columns are identical from line to line, but may be skipped during a multicolumn cell.

For HTML output, `@` and `!` columns are placed into their own tabular columns. Thus, a LaTeX `\multicolumn` command may span several additional `@` and `!` columns in HTML output. These additional columns must be added to the total number of columns spanned by an HTML multi-column data cell.

```
\newcounter{LWR@tabhtmlcolindex}
\newcounter{LWR@tabhtmlcolend}
\newcounter{LWR@tabhtmlcoltotal}
```

`\LWR@subtabularhtmlcolumns` {⟨*index*⟩}

Factored from `\LWr@tabularhtmlcolumns`, which follows.

```
\newcommand*{\LWR@subtabularhtmlcolumns}[1]{%
```

Temporarily define a macro equal to the `@` specification for this column:

```
    \edef\LWR@atbangspec{\LWR@getexparray{LWR@colatspec}{#1}}%
```

If the `@` specification is not empty, add to the count:

```
    \ifdefempty{\LWR@atbangspec}%
        {}%
        {\defaddtocounter{LWR@tabhtmlcoltotal}{1}}%
```

Likewise for the `!` columns:

```
    \edef\LWR@atbangspec{\LWR@getexparray{LWR@colbangspec}{#1}}%
```

```
    \ifdefempty{\LWR@atbangspec}%
        {}%

`\LWR@tabularhtmlcolumns` {⟨*starting LaTeX column*⟩} {⟨*number LaTeX columns*⟩}

Compute the total number of HTML columns being spanned, considering the starting LaTeX table column and the number of LaTeX tabular columns being spanned. Any `@` and `!` columns within this span are included in the total count. The resulting number of HTML columns is returned in the counter `LWR@tabhtmlcoltotal`.

```
\newcommand*{\LWR@tabularhtmlcolumns}[2]{%
```

Count the starting index, compute ending index, and begin with the count being the LaTeX span, to which additional `@` and `!` columns may be added:

```
    \defcounter{LWR@tabhtmlcolindex}{#1}%
    \defcounter{LWR@tabhtmlcoltotal}{#2}%
    \defcounter{LWR@tabhtmlcolend}{#1}%
    \defaddtocounter{LWR@tabhtmlcolend}{#2}%
```

If at the left edge, add the at/bang columns for the left edge:

```
    \ifnumcomp{\value{LWR@tabhtmlcolindex}}{=}{1}{%
        \LWR@subtabularhtmlcolumns{leftedge}%
    }{}%
```

Walk across the LaTeX columns looking for `@` and `!` columns:

```
    \whileboolexpr{%
        test {%
        \ifnumcomp{\value{LWR@tabhtmlcolindex}}{<}{\value{LWR@tabhtmlcolend}}%
        }%
    }%
    {%
        \LWR@subtabularhtmlcolumns{\arabic{LWR@tabhtmlcolindex}}%
        \defaddtocounter{LWR@tabhtmlcolindex}{1}%
    }% whiledo
}
```

```
\end{warpHTML}
```

75.23 Multirow if not loaded

A default defintion in case multirow is not loaded. This is used during table parsing.

```
\begin{warpHTML}
\newcommand{\multirow}[2][c]{}
\end{warpHTML}
```

75.24 Multicolumnrow

A print-mode version is defined here, and is also used during HTML output while inside a `lateximage`.

See section 429 for the HTML versions.

for HTML & PRINT:
```
\begin{warpall}
```

`\multicolumnrow` {⟨*1:cols*⟩} {⟨*2:halign*⟩} [⟨*3:vpos*⟩] {⟨*4:numrows*⟩} [⟨*5:bigstruts*⟩] {⟨*6:width*⟩} [⟨*7:fixup*⟩] {⟨*8:text*⟩}

For discussion of the use of `\DeclareExpandableDocumentCommand`, see:
https://tex.stackexchange.com/questions/168434/problem-with-abbreviation-of-multirow-and-multicolumn-latex

`\AtBeginDocument` to adjust after the user may have loaded multirow, which requires several tests to determine which version is loaded and thus which options are available.

```
\AtBeginDocument{
```

`\@ifundefined{@xmultirow}` determines if multirow was never loaded.

Null action if not loaded:

```
\@ifundefined{@xmultirow}
{
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {}%
}% no version of multirow was loaded
{% \@xmultirow defined, so some version of multirow was loaded
```

`\IfPackageLoadedTF{multirow}` determines if v2.0 or later of multirow was used, which included the `\ProvidesPackage` macro.

The print version:

```
\IfPackageLoadedTF{multirow}{% v2.0 or newer
\IfPackageAtLeastTF{multirow}{2016/09/01}% 2016/09/27 for v2.0
{% v2.0+:
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow[#3]{#4}[#5]{#6}[#7]{#8}}}%
}
{% loaded but older, probably not executed:
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow{#4}[#5]{#6}[#7]{#8}}}%
}
}% packageloaded{multirow}
```

If not `\IfPackageLoadedTF{multirow}` but `\@xmultirow` is defined, then this must be v1.6 or earlier, which did not `\ProvidesPackage{multirow}`, and did not have the vposn option.

```
{% v1.6 or older did not \ProvidePackage
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow{#4}[#5]{#6}[#7]{#8}}}%
}

```

```
}% \@ifundefined{@xmultirow}

\providecommand*{\multicolumnrow}{\LWR@print@multicolumnrow}

75.25 Utility macros inside a table

for HTML output:

```
\begin{warpHTML}
```

Used to prevent opening a tabular data cell if the following token is one which does not create tabular data:

```
\newcommand*{\LWR@donothing}{}
```

In case array is not loaded:

```
\let\firsthline\relax
\let\lasthline\relax
\newcommand*{\firsthline}{}
\newcommand*{\lasthline}{}
```

In case bigdelim is not loaded:

```
\newcommand*{\ldelim}{}
\newcommand*{\rdelim}{}
```

```
\end{warpHTML}
```

75.26 Special-case tabular markers

for HTML & PRINT:

```
\begin{warpall}
```

`\TabularMacro` Place this just before inserting a custom macro in a table data cell. Doing so tells lwarp not to automatcally start a new HTML table data cell yet. See section 8.10.1.

```
\newcommand*{\TabularMacro}{}
```

```
\end{warpall}
```

`\ResumeTabular` Used to resume tabular entries after resuming an environment.

⚠ `tabular` inside another environment

When creating a new environment which contains a `tabular` environment, lwarp's emulation of the tabular does not automatically resume when the containing enviroment ends, resulting in corrupted HTML rows. To fix this, use `\ResumeTabular` as follows. This is ignored in print mode.

```
\StartDefiningTabulars %   (& is used in a definition)
\newenvironment{outerenvironment}
{
   \tabular{cc}
   left & right \\
}
{
   \TabularMacro\ResumeTabular
   left & right \\
   \endtabular
}
\StopDefiningTabulars
```

for HTML output:

```
\begin{warpHTML}

\newcommand*{\ResumeTabular}{%
    \boolfalse{LWR@exitingtabular}%
    \boolfalse{LWR@tabularmutemods}%
    \LWR@getmynexttoken%
}

\end{warpHTML}
```

for PRINT output:

```
\begin{warpprint}

\newcommand*{\ResumeTabular}{}

\end{warpprint}
```

75.27 Checking for a new table cell

for HTML output:

```
\begin{warpHTML}
```

`\LWR@tabledatacolumntag` Open a new HTML table cell unless the next token is for a macro which does not create data, such as `\hline`, `\toprule`, etc:

```
\newcommand*{\LWR@tabledatacolumntag}%
{%
    \LWR@traceinfo{LWR@tabledatacolumntag}%
```

`\show\LWR@mynexttoken` to see what tokens to look for

If not any of the below, start a new table cell:

```
    \global\let\LWR@mynextaction\LWR@tabledatasinglecolumntag%
```

If exiting the tabular:

```
    \ifdefequal{\LWR@mynexttoken}{\end}%
        {\booltrue{LWR@exitingtabular}}{}%
```

`longtable` can have a caption in a cell

```
    \ifdefequal{\LWR@mynexttoken}{\caption}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%
```

Look for other things which would not start a table cell:

```
    \ifdefequal{\LWR@mynexttoken}{\multicolumn}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%
    \ifdefequal{\LWR@mynexttoken}{\multirow}%

    \ifdefequal{\LWR@mynexttoken}{\noalign}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%
```

If an `\mrowcell`, this is a cell to be skipped over:

```
    \ifdefequal{\LWR@mynexttoken}{\mrowcell}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%
```

If an `\mcolrowcell`, this is a cell to be skipped over:

```
    \ifdefequal{\LWR@mynexttoken}{\mcolrowcell}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%

    \ifdefequal{\LWR@mynexttoken}{\TabularMacro}%

        {\global\let\LWR@mynextaction\LWR@donothing}{}%

    \ifdefequal{\LWR@mynexttoken}{\cdashline}%

    \ifdefequal{\LWR@mynexttoken}{\lasthdashline}%
        {\global\let\LWR@mynextaction\LWR@donothing}{}%

⚠ <table> inside

In LaTeX, a tabular may be placed inside a minipage, but in HTML a <table> may not be inside a . Since there may be several nested s, with an unknown number of other objects between, it is hard to undo all these s before the <table> then redo them after. The broswer probably compensates for this situation, but formatting may be lost inside the <table> because several things are neutralized inside a . Furthermore, in the HTML output, the entire <table> is placed on a single line of HTML code, since the line breaking commands are neutralized inside a . Since this is such a sloppy situation, a warning is issued here instructing the user to please isolate the to print-only.

76 Cross-references

Sectioning commands have been emulated from scratch, so the cross-referencing commands are custom-written for them. Emulating both avoids several layers of patches.

File *_html.aux

A new entry in *_html.aux is used to remember section name, file, and lateximage depth and number for each label:

```
\newlabel{<labelname>@lwarp}{{<section name>}{<filename>}
                                    {<limagedepth>}{<limagenumber>}}
```

Table 16 shows the data structures related to cross-referencing.

for HTML output: 10361 \begin{warpHTML}

76.1 Setup

\@currentlabelname

To remember the most recently defined section name, description, or caption, for \nameref.

10362 \def\@currentlabelname{\linkhomename}%

\LWR@stripperiod {⟨*text*⟩} [⟨.⟩]

Removes a trailing period.

10363 \def\LWR@stripperiod#1.\ltx@empty#2\@nil{#1}%

\LWR@setlatestname {⟨*object name*⟩}

Removes \label, strips any final period, and remembers the result.

10364 \newcommand*{\LWR@setlatestname}[1]{%

Remove \label and other commands from the name, the strip any final period. See gettitlestring.

76.2 New lwarp labels.

File *_html.aux

A new entry in *_html.aux is used to remember section name, file, and lateximage depth and number for each label:

Table 16: Cross-referencing data structures

Original LaTeX: (print and HTML)

\refstepcounter: Steps the couunter and sets \@currentlabel.

\@currentlabel: \p@<ctr>\the<ctr> Updated by \refstepcounter.

\label: Writes to the .aux file:
\newlabel{<label>}{{\@currentlabel}{\thepage}}

\newlabel: When the .aux file is read, sets \r@<label>.

\r@<label>: Set to: {{\@currentlabel}{\thepage}}

\ref: Returns the first part of \r@<label>.

\pageref: Returns the second part of \r@<label>.

Added by lwarp: (HTML only)

\label: Adds HTML tags (section 76.3), and another .aux entry (section 76.2). If memoir is used, its \@mem@old@label points to lwarp's version, and cleveref patches.

\newlabel: Unchanged. When the .aux file is read, sets \r@<label>@lwarp.

\r@<label>@lwarp: Set to {{section_name}{file_name}{depth}{number}}:

\LWR@nameref: The section or object name for this label.

\LWR@currentautosecpageref: The LWR@currentautosecpage for this label.

\LWR@htmlfileref: The filenumber or name for this label.

\LWR@lateximagedepthref: The lateximagedepth for this label.

\LWR@lateximagenumberref: The lateximagenumber for this label.

\nameref: Emualted from hyperref for lwarp. See section 76.4.

\ref and \nameref: Adds HTML tags. See section 76.4.

Added by amsmath: (print and HTML)

\label: Execution is delayed until the math environment is completed.

\ltx@label: LaTeX \label, (HTML: patched by lwarp,) later patched by cleveref.

Added by cleveref: (print and HTML)

\refstepcounter: Added: sets \cref@currentlabel.

\cref@currentlabel: (<type>=<ctr> unless an alias is used):
[<type>][\arabic{<ctr>}][<parent ctrs>]{\p@<ctr>\the<ctr>} Also see section 60.4 for use with footnotes.

\label: Writes to the .aux file:
\newlabel{<label>@cref}{{\cref@currentlabel}{\thepage}}

\newlabel: Unchanged. When the .aux file is read, sets \r@<label>@cref.

\r@<label>@cref: Set to: {{\cref@currentlabel}{\thepage}}

Utility functions: See \cref@getlabel, \cref@gettype, \cref@getcounter, \cref@getprefix.

Cross-referencing names: \crefname and \Crefname assign human-readable names for references to this counter type.

Additionally patched by lwarp: (HTML only)

\cref, etc.: Modified for lwarp. See section 202.

\label inside math: See section 83.7.1.

Footnotes: See \noteentry in section 60.4.

```
\newlabel{<labelname>@lwarp}{{<section name>}{<filename>}
                                    {<limagedepth>}{<limagenumber>}}

See:
http://tex.stackexchange.com/questions/57194/extract-section-number-from-equation-reference

\LWR@setref {⟨*args list*⟩} {⟨*selector*⟩} {⟨*label*⟩}

\@setref without the \null (\hbox), and without the warning messages. Each caused problems with lwarp references. The regular reference will cause the warning.

```
\def\LWR@setref#1#2#3{%
  \ifx#1\relax%
    ??%
  \else%
   \expandafter#2#1%
  \fi}
```

\LWR@nameref {⟨*label*⟩} Returns the section name for this label:

```
\newcommand*{\LWR@nameref}[1]{%
    \begingroup%
    \LWR@nullifyfootnotes%
   \expandafter\LWR@setref\csname r@#1@lwarp\endcsname\LWR@firstoffive{#1}%

```

\LWR@lateximagedepthref {⟨*label*⟩} Returns the lateximagedepth for this label:

```
\newcommand*{\LWR@lateximagedepthref}[1]{%
   \expandafter\LWR@setref\csname r@#1@lwarp\endcsname\LWR@fourthoffive{#1}%
}
```

\LWR@lateximagenumberref {⟨*label*⟩} Returns the lateximagenumber for this label:

```
\newcommand*{\LWR@lateximagenumberref}[1]{%
   \expandafter\LWR@setref\csname r@#1@lwarp\endcsname\LWR@fifthoffive{#1}%
}
```

\LWR@write@lwarplabel {⟨*label*⟩} Sanitize the name and then creates the label:

```
\newcommand*{\LWR@write@lwarplabel}[1]{%
    \LWR@traceinfo{LWR@write@lwarplabel !#1!}%
    \LWR@setlatestname{\@currentlabelname}%

                            {\arabic{LWR@htmlfilenumber}}%
                    }%
                    {\arabic{LWR@lateximagedepth}}%
                    {\arabic{LWR@lateximagenumber}}%
                }%
            }%
        \@esphack%
}
```

76.3 Labels

\LWR@label@subcreatetag Creates the tag from \LWR@sanitized.

```
\newcommand*{\LWR@label@subcreatetag}{%
   \LWR@htmltag{a \LWR@print@mbox{id=\textquotedbl\LWR@sanitized\textquotedbl}}%
    \LWR@htmltag{/a}%

```

\LWR@label@inmathcomment

```
\newcommand*{\LWR@label@inmathcomment}{%
    \ifboolexpr{bool{mathjax} or ( bool{FormatWP} and bool{WPMarkMath} ) }%
    {%
```

The combined LaTeX & HTML label is printed in a \mbox field:

```
        \mbox{%
```

Shift the label over to the right side of the environment to avoid over-printing the math:

```
        \ifdef{\totwidth@}{\ifbool{LWR@amsmultline}{}{\hspace*{\totwidth@}}}{}%
```

Temporarily end the HTML comment, insert the LaTeX & HTML label, then resume the HTML comment. \@firstofone is required to remove extra braces introduced by the amsmath package.)

```
            \LWR@htmlclosecomment%
            \LWR@label@subcreatetag%
            \LWR@htmlopencomment%

    }% mathjax
```

```
    {%
        \LWR@label@subcreatetag%
    }%
}
```

`\LWR@label@createtag` {⟨*label*⟩} Creates an HTML id tag.

Used by `\LWR@new@label` and `\hyperdef`.

`\detokenize` is used to allow underscores in the labels.

```
\newcommand*{\LWR@label@createtag}[1]{%
    \LWR@traceinfo{LWR@label@createtag !#1!}%
```

Create an HTML id tag unless are inside a lateximage, since it would appear in the image:

```
    \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
    {}%
    {% not lateximage
```

If not doing a lateximage, create an HTML ID tag.

```
        \LWR@sanitize{#1}%
        \ifbool{LWR@insidemathcomment}%
        {% inside HTML math comment
            \LWR@label@inmathcomment%

            }% pars allowed
            {% pars not allowed
                    \LWR@label@subcreatetag%
            }% pars not allowed
        }% not inside HTML math comment
    }% not lateximage
}
```

`\LWR@new@label` {⟨*label*⟩}

`\label` during HTML output when not in SVG math mode, removing extra spaces around the label, as done by a regular LaTeX `\label`.

The is also used during a `lateximage`, including SVG math, since the special label handling is required, but `\LWR@label@createtag` does not generate HTML tags inside a `lateximage`.

If memoir is used, it's `\@mem@old@label` is pointed here.

clevereref later encases this to add its own cross-referencing, and also patches memoir.

```
\newcommand*{\LWR@new@label}[1]{%
    \LWR@traceinfo{LWR@new@label: starting}%
    \LWR@traceinfo{LWR@new@label: !#1!}%
% \@bsphack%
```

Create a traditional LaTeX label, as modified by cleveref:

```
    \LWR@orig@label{#1}%
```

Create a special label which holds the section number, section name, `LWR@htmlfilenumber`, `LWR@lateximagedepth`, and `LWR@lateximagenumber`:

```
    \LWR@traceinfo{%
        LWR@new@label: filesectionnames is %
        \ifbool{FileSectionNames}{true}{false}%
    }%
    \LWR@traceinfo{%
        LWR@new@label: LWR@thisfilename is !\LWR@thisfilename!%
    }%
    \LWR@traceinfo{%
        LWR@new@label: LWR@htmlfilenumber is \arabic{LWR@htmlfilenumber}%
    }%
    \LWR@write@lwarplabel{#1}%
    \LWR@label@createtag{#1}%
    % \@esphack%
    \LWR@traceinfo{LWR@new@label: done}%
}
```

76.4 References

`\LWR@addlinktitle`

```
\newcommand*{\LWR@addlinktitle}{%
    \ifdefvoid{\LWR@ThisAltText}{}{ % space
        title=\textquotedbl\LWR@ThisAltText\textquotedbl\ % space
        \gdef\LWR@ThisAltText{}%
    }%
}
```

`\LWR@startref` {⟨*label*⟩} (Common code for `\ref` and `\nameref`.)

Open an HTML tag reference to a filename, # character, and a label.

```
\newcommand*{\LWR@startref}[1]
{%
    \LWR@sanitize{#1}%
    \LWR@traceinfo{LWR@startref A: !#1!}%
```

Create the filename part of the link:

```
    \LWR@htmltag{a href=\textquotedbl%
    \LWR@traceinfo{LWR@startref B}%
```

```
    \LWR@print@mbox{\LWR@htmlrefsectionfilename{#1}}%
    \LWR@traceinfo{LWR@startref C}%
    \LWR@origpound%
```

Create the destination id:

See if `LWR@lateximagedepth` is unknown:

```
    \LWR@traceinfo{LWR@startref D: !#1!}%
    \ifcsundef{r@#1@lwarp}%
```

"??" if `LWR@lateximagedepth` is unknown, so create a link with an unknown destination:

```
    {%
        \LWR@traceinfo{LWR@startref D0: ??}%
        ??%
    }%
```

If `LWR@lateximagedepth` is known. Use a lateximage if the depth is greater than zero, or a regular link otherwise:

```
    {%
        \ifthenelse{\cnttest{\LWR@lateximagedepthref{#1}}{>}{0}}%
            {%

                lateximage-\BaseJobname-\LWR@lateximagenumberref{#1}%
            }%
            {%
                \LWR@traceinfo{LWR@startref D3}%
```

`\detokenize` is used to allow underscores in the labels:

```
                \LWR@print@mbox{\LWR@sanitized}%
            }%
    }%
    \LWR@traceinfo{LWR@startref E}%
```

Closing quote:

```
    \textquotedbl%
```

Maybe add a title:

```
    \LWR@addlinktitle%
    }%
    \LWR@traceinfo{LWR@startref F}%
}
```

`\LWR@subnewref` {⟨*label*⟩} {⟨*label or sub@label*⟩}

Factored for the subfig package. Uses the original label for the hyper-reference, but prints its own text, such as "`1(b)`".

```
\NewDocumentCommand{\LWR@subnewref}{m m}{%
    \LWR@traceinfo{LWR@subnewref #1 #2}%
    \LWR@startref{#1}%
```

```
    \LWR@print@ref{#2}%
    \LWR@htmltag{/a}%
}
```

`\ref` * {⟨*label*⟩}

`\ref` is redefined to `\LWR@HTML@ref`, except inside the text part of a `\hyperref`, where it is redefined to `\LWR@ref@ignorestar`.

`\LWR@HTML@ref` * {⟨*label*⟩} Create an internal document reference link, or without a link if starred per hyperref.

hyperref defines a starred version. Since hyperref is only emulated, the starred version is defined here for print mode, in case `\ref` is used inside SVG math:

```
\LWR@absorbstar{ref}%
```

The HTML version:

```
\NewDocumentCommand{\LWR@HTML@ref}{s m}{%
    \LWR@traceinfo{LWR@HTML@ref !#2!}%
    \IfBooleanTF{#1}%
        {\LWR@print@ref{#2}}%
        {\LWR@subnewref{#2}{#2}}%
}

\LWR@formatted{ref}
```

`\LWR@refwithsection` * {⟨*label*⟩}

Creates a reference, using the section number as the text. Used for back references.

```
\NewDocumentCommand{\LWR@refwithsection}{s m}{%
    \LWR@traceinfo{LWR@refwithsection !#2!}%
```

If starred, just use the text without a hyperlink:

```
    \IfBooleanTF{#1}%
     {\LWR@print@ref{\BaseJobname-autopage-\LWR@currentautosecpageref{#2}}}%
        {%
```

Open the reference:

```
            \LWR@startref{#2}%
```

Add the text of the link.

Check for and handle an undefined reference:

```
            \edef\@tempa{\LWR@currentautosecpageref{#2}}%
            \ifdefstring{\@tempa}{??}%
                {??}%
```

For a defined reference:

```
                {%
```

Set \@tempa to \r@<label>, which is {section number}{page number}.

```
                \edef\@tempa{%
                    \csname
                r@\BaseJobname-autopage-\LWR@currentautosecpageref{#2}%
                    \endcsname%
                }%
```

Check the section number alone:

```
                \edef\@tempa{\expandafter\@firstoftwo\@tempa}%
```

If the reference has no section number print an asterisk:

```
                \expandafter\ifblank\expandafter{\@tempa}%
                    {*}
```

If there is a section number, print it:

```
                    {%
                        \LWR@print@ref{%
                  \BaseJobname-autopage-\LWR@currentautosecpageref{#2}%
                        }%
                    }%
            }%
```

Close the reference:

```
            \LWR@htmltag{/a}%
        }%
}
```

For MathJax:

```
\CustomizeMathJax{\let\LWRref\ref}
\CustomizeMathJax{\renewcommand{\ref}{\ifstar\LWRref\LWRref}}
```

\pagerefPageFor Text for page references.

```
\newcommand*{\pagerefPageFor}{see }
```

\pageref * {⟨*label*⟩} Create an internal document reference, or just the unlinked number if starred, per hyperref.

```
\NewDocumentCommand{\LWR@new@pageref}{s m}{%
    \IfBooleanTF{#1}%
        {(\pagerefPageFor\LWR@print@ref{#2})}%
        {(\cpageref{#2})}%
}
```

\nameref {⟨*label*⟩}

```
\newrobustcmd*{\nameref}[1]{%
    \LWR@traceinfo{nameref}%
```

```
    \LWR@startref{#1}%
    \LWR@traceinfo{nameref B}%
    \LWR@nameref{#1}%
    \LWR@traceinfo{nameref C}%
    \LWR@htmltag{/a}%
    \LWR@traceinfo{nameref: done}%
}
```

`\Nameref` {⟨*label*⟩} In print, adds the page number. In HTML, does not.

```
\LetLtxMacro\Nameref\nameref
```

76.5 Hyper-references

⚠ Note that the code currently only sanitizes the underscore character. Additional characters should be rendered inert as well. See the `hyperref.sty` definition of `\gdef\hyper@normalise` for an example.

Pkg `hyperref`

⚠ Do not tell other packages that hyperref is emulated. Some packages patch various commands if hyperref is present, which will probably break something, and the emulation already handles whatever may be emulated anyhow.

```
% DO NOT TELL OTHER PACKAGES TO ASSUME HYPERREF, lest they attempt to patch it:
% \EmulatesPackage{hyperref}[2015/08/01]% Disabled.  Do not do this.
```

Emulates hyperref:

`\@currentHref` Added to support backref.

```
\AtBeginDocument{
    \def\@currentHref{\BaseJobname-autopage-\theLWR@previousautopagelabel}%
}
```

`\LWR@linkcatcodes` Sets catcodes before processing macros which have hyperlinks as arguments.

```
\newcommand*{\LWR@linkcatcodes}{%
    \catcode`\#=12%
    \catcode`\%=12%
    \catcode`\&=12%
    \catcode`\~=12%
    \catcode`\_=12%
```

For babel-french:

```
    \LWR@hook@processingtags%
}
```

`\LWR@linkmediacatcodes` Sets catcodes before processing macros which have hyperlinks as arguments. Modified for multimedia links.

```
\newcommand*{\LWR@linkmediacatcodes}{%
    \catcode`\#=12%
```

```
    \catcode`\%=12%
% \catcode`\&=12% left alone for splitting flash variables
    \catcode`\~=12%
    \catcode`\_=12%
```

For babel-french:

```
    \LWR@hook@processingtags%
}
```

`\LWR@subhyperref` {⟨*URL*⟩}

Starts a link for `\LWR@hrefb`. A group must have been opened first, with nullified catcodes. The text name is printed afterwards, after the group is closed and catcodes restored.

```
\NewDocumentCommand{\LWR@subhyperref}{m}{%
    \LWR@traceinfo{LWR@subhyperref !#1!}%
    \LWR@sanitize{#1}%
    \LWR@htmltag{%

Table 17: Float data structures

For each <type> of float (figure, table, etc.) there exists the following:

counter <type>: A counter called <type>, such as `figure`, `table`.

\<type>name: Name. `\figurename` prints "Figure", etc.

\ext@<type>: File extension. `\ext@figure` prints "lof", etc.

\fps@<type>: Placement.

\the<type>: Number. `\thetable` prints the number of the table, etc.

\p@<type>: Parent's number. Prints the number of the [within] figure, etc.

\fnum@<type>: Prints the figure number for the caption.
`\<type>name \the<type>`, "Figure 123".

\<type>: Starts the float environment. `\figure` or `\begin{figure}`

\end<type>: Ends the float environment. `\endfigure` or `\end{figure}`

\tf@<ext>: The LaTeX file identifier for the output file.

LWR@have<type>: A boolean remembering whether a `\listof` was requested for a float of this type.

File with extension lo<f,t,a-z>: An output file containing the commands to build the `\listof<type>` "table-of-contents" structure.

Cross-referencing names: For cleveref's `\cref` and related, `\crefname` and `\Crefname` assign human-readable names for references to this float type.

77 Floats

Floats are supported, although partially through emulation.

Table 17 shows the data structure associated with each <type> of float.

77.1 Float environment

```
\begin{warpHTML}
```

`\LWR@floatbegin` `{`⟨*type*⟩`}` `[`⟨*placement*⟩`]` Begins a `\newfloat` environment.

```
\NewDocumentCommand{\LWR@floatbegin}{m o}{%

Settings while inside the environment:

77.4 Caption and LOF linking and tracking

When a new HTML file is marked in the LaTeX PDF file, or at the start of a new section, the LaTeX PDF page number at that point is stored in `LWR@currentautosecfloatpage`, (and the associated filename is remembered by the special LaTeX labels). This page number is used to generate an `autopage` HTML `<id>` in the HTML output at the start of the new HTML file or section. Meanwhile, there is a float counter used to generate an HTML `autoid` `<id>` at the start of the float itself in the HTML file. The `autopage` and `autoid` values to use for each float are written to the `.lof`, etc. files just before each float's entry. These values are used by `\l@figure`, etc. to create the HTML links in the List of Figures, etc.

Ctr `LWR@nextautoid`

Ctr `LWR@nextautopage`

Tracks `autoid` for floats. Tracks `autopage` for floats.

These are updated per float as the `.lof`, `.lot` file is read.

```
\newcounter{LWR@nextautoid}
\newcounter{LWR@nextautopage}
```

`\LWRsetnextfloat` {⟨*autopage*⟩} {⟨*float autoid*⟩}

File `*_html.lof`

File `*_html.lot`

This is written to the `*_html.lof` or `*_html.lot` file just before each float's usual entry. The `autopage` and the float's `autoid` are remembered for `\l@figure` to use when creating the HTML links.

```
\newcommand*{\LWRsetnextfloat}[2]{%
    \setcounter{LWR@nextautopage}{#1}%
    \setcounter{LWR@nextautoid}{#2}%
}
```

Env `LWR@figcaption`

An HTML `<figcaption>` is not allowed in places where LaTeX does allow a figure caption, such as inside a `longtable` where the tabular has already started, or inside a `center` environment. Therefore, a `<div>` of class `figurecaption` is used instead.

```
\newenvironment*{LWR@figcaption}
    {%
        \ifbool{FormatWP}{%
            \BlockClass[font-style:italic]{figurecaption}%
        }{%
            \BlockClass{figurecaption}%
        }%
```

Inside the caption, temporarily prevent underfull `\hbox` warnings, such as when the caption contains a math SVG image.

```
            \hbadness=10000\relax%
    }%
    {\endBlockClass}
```

\LWR@HTML@caption@begin {⟨*type*⟩}

Low-level code to create HTML tags for captions.

The print versions are from the caption package, if loaded.

```
\newcommand*{\LWR@HTML@caption@begin}[1]
{%
    \LWR@traceinfo{LWR@HTML@caption@begin}%

Keep par and minipage changes local:

```

No need for a minipage or \parbox inside the caption:

```
    \RenewDocumentEnvironment{minipage}{O{t} o O{t} m}{}{}%
    \RenewDocumentCommand{\parbox}{O{t} O{} O{t} m +m}{##5}%
```

Enclose the original caption code inside an HTML tag:

```
    \LWR@figcaption%
    \LWR@traceinfo{LWR@HTML@caption@begin: about to LWR@origcaption@begin}%
    \LWR@print@caption@begin{#1}%
    \LWR@traceinfo{LWR@HTML@caption@begin: done}%

```

\LWR@HTML@caption@end Low-level patches to create HTML tags for captions.

```
\newcommand*{\LWR@HTML@caption@end}
{%
    \LWR@traceinfo{LWR@HTML@caption@end}%
    \LWR@print@caption@end%
```

Closing tag:

```
    \endLWR@figcaption%
    \endgroup%
    % \leavevmode% avoid bad space factor (0) error
    \LWR@traceinfo{LWR@HTML@caption@end: done}%
}
```

\caption@begin

78 Table of Contents, LOF, LOT

This section controls the generation of the TOC, LOF, and LOT.

The `.toc`, `.lof`, and `.lot` files are named by the source code `\jobname`.

In HTML, the printed tables are placed inside a `<div>` of class `toc`, `lof`, or `lot`.

A "sidetoc" is provided which prints a subset of the TOC on the side of each page other than the homepage.

The regular LaTeX infrastructure is used for TOC, along with some patches to generate HTML output.

for HTML output:

```
\begin{warpHTML}
```

78.1 Reading and printing the TOC

\LWR@myshorttoc {⟨*toc/lof/lot/sidetoc*⟩}

Reads in and prints the TOC/LOF/LOT at the current position. While doing so, makes the `@` character into a normal letter to allow formatting commands in the section names.

Unlike in regular LaTeX, the file is not reset after being read, since the sideTOC may be referred to again in each HTML page.

```
\newcommand*{\LWR@myshorttoc}[1]{%
    \LWR@traceinfo{LWR@myshorttoc: #1}%
```

Only if the file exists:

```
    \IfFileExists{\jobname.#1}{%
        \LWR@traceinfo{LWR@myshorttoc: loading}%
```

⚠ Many of the commands in the file will have `@` characters in them, so `@` must be

made a regular letter.

```
        \begingroup%
        \makeatletter%
```

Disable \ref to avoid nested HTML references.

```
     \LetLtxMacro\ref\LWR@print@ref%
     \LWR@disablepinyin%
```

Read in the TOC file:

```
        \@input{\jobname.#1}%
        \endgroup%
    }%
    {}%
    \LWR@traceinfo{LWR@myshorttoc: done}%
}
```

\LWR@subtableofcontents {⟨*toc/lof/lot*⟩} {⟨*sectionstarname*⟩}

Places a TOC/LOF/LOT at the current position.

```
\NewDocumentCommand{\LWR@subtableofcontents}{m m}{%
```

Closes previous levels:

```
    \@ifundefined{chapter}%
        {\LWR@closeprevious{section}}%
        {\LWR@closeprevious{chapter}}%
```

Prints any pending footnotes so that they appear above the potentially large TOC:

```
    \LWR@printpendingfootnotes%
```

Place the list into its own chapter (if defined) or section:

```
    \@ifundefined{chapter}{\section*{#2}}{\chapter*{#2}}%
```

Create a new HTML nav containing the TOC/LOF/LOT:

```
    \LWR@htmlelementclass{nav}{#1}%
```

Create the actual list:

```
    \LWR@myshorttoc{#1}%
```

Close the nav:

```
    \LWR@htmlelementclassend{nav}{#1}%
}
```

\@starttoc {⟨*ext*⟩}

Patch \@starttoc to encapsulate the TOC inside HTML tags:

```
\let\LWR@orig@starttoc\@starttoc

\renewcommand{\@starttoc}[1]{
    \LWR@htmlelementclass{nav}{#1}%
    \LWR@orig@starttoc{#1}%
    \LWR@htmlelementclassend{nav}{#1}%
}
```

Bool `LWR@copiedsidetoc` Used to only copy the TOC file to the sidetoc a single time.

(listings and perhaps other packages would re-use `\tableofcontents` for their own purposes, causing the sidetoc to be copied more than once, and thus end up empty.)

```
\newbool{LWR@copiedsidetoc}
\boolfalse{LWR@copiedsidetoc}
```

`\tableofcontents` Patch `\tableofcontents`, etc. to print footnotes first. newfloat uses `\listoffigures` for all future float types.

```
\AtBeginDocument{

\LetLtxMacro\LWR@origtableofcontents\tableofcontents

\renewcommand*{\tableofcontents}{%

78.2 TOC commands

\LWR@listof {⟨*type*⟩} {⟨*title*⟩}

Emulate the \listof command from the float package (section 276). Used to create lists of custom float types. Also used to redefine the standard LaTeX \listoffigures and \listoftables commands, and in tocloft and memoir.

```
\NewDocumentCommand{\LWR@listof}{m +m}{%
    \@ifundefined{l@#1}{%
```

```

78.3 Side TOC

The "side TOC" is a table-of-contents positioned to the side.

It may be renamed by redefining `\sidetocname`, and may contain paragraphs.

Per table 18, CSS may be used to format the sideTOC.

Table 18: CSS related to the sideTOC

`div.sidetoccontainer`: The entire sideTOC.

`div.sidetoctitle`: The title.

`div.sidetoccontents`: The table of contents.

```
\end{warpHTML}
```

for HTML & PRINT:

```
\begin{warpall}
```

Ctr `SideTOCDepth`

Controls how deep the side-TOC gets. Use a standard LaTeX section level similar to `tocdepth`. Warn if parts of the website may be inaccessible.

```
\newcounter{SideTOCDepth}
\setcounter{SideTOCDepth}{1}

\AtEndDocument{%
  \ifnumcomp{\value{SideTOCDepth}}{<}{\value{FileDepth}}{

    {%
      SideTOCDepth is less than FileDepth,\MessageBreak
      so some website pages may be inaccessible%
    }
  }{}
}
```

`\sidetocname` Holds the default name for the sideTOC.

```
\newcommand{\sidetocname}{Contents}

```
\end{warpall}
```

for HTML output:

```
\begin{warpHTML}

(Called from each line in the .aux, .lof files.)

Record this section number for further use:

```
\newcommand*{\LWR@numberline}[1]{%
    \LWR@sectionnumber{#1}\quad%
}

\LetLtxMacro\numberline\LWR@numberline
```

`\LWR@maybetocdata` Replaced by tocdata. Adds author name.

```
\newcommand*{\LWR@maybetocdata}{}
```

`\hypertoc` {⟨*1: depth*⟩} {⟨*2: type*⟩} {⟨*3: name*⟩} {⟨*4: page*⟩}

Called by \l@section, etc. to create a hyperlink to a section.

The autopage label is always created just after the section opens.

#1 is depth

#2 is section, subsection, etc.

#3 the text of the caption

#4 page number

```

79 Index and glossary

See:
http://tex.stackexchange.com/questions/187038/how-to-mention-section-number-in-index-created-by-imakeidx

Index links are tracked by the counter `LWR@autoindex`. This counter is used to create a label for each index entry, and a reference to this label for each entry in

the index listing. This method allows each index entry to link directly to its exact position in the document.

for HTML output:

```

`\hyperindexref` {⟨*list of LWR@autoindex, commas, and ranges*⟩}

`\hyperindexref{LWR@autoindex}` is inserted into `*.ind` by the ***makeindex*** style file `lwarp.ist` or the ***xindy*** style file `lwarp.xdy`. For ***xindex***, `\hyperpage` is inserted, which is `\let` to `\hyperindexref`. For ***gindex***, `\addindexitem` and related are inserted, which are defined to use `\hyperindexref`.

The argument is split at commas, and also for ranges, then passed to `\LWR@hyperindexrefsub`.

80 Bibliography presentation

for HTML output:

```
\begin{warpHTML}
```

\bibliography {⟨*filenames*⟩} At one time this was modified to read `\BaseJobname.bbl`, which meant the HTML version could not resolve until the print version was also present. This also confused multibib. It has been reverted to the original to use `\jobname.bbl`.

Env thebibliography To emphasize document titles in the bibliography, the following redefines `\em` inside `thebibliography` to gather everything until the next closing brace, then display these tokens with `\textit`.

81 Restoring original formatting

for HTML output:

```
\begin{warpHTML}
```

`\LWR@restoreMathJaxformatting`

A few macros (ref: tcolorbox) must be treated separately while printing the HTML comment for a MathJax expression. These are set here, to which other functions may be appended.

```
\newcommand*{\LWR@restoreMathJaxformatting}{}
```

`\LWR@restoreorigformatting`

Used to temporarily restore the print-mode meaning of a number of formatting, graphics, and symbols-related macros while generating SVG math or a `lateximage`.

Must be used inside a group.

Sets `\LWR@formatting` to `print` until the end of the group.

A number of packages will `\appto` additional actions to this macro.

Various packages add to this macro using `\appto`.

```
\newcommand*{\LWR@restoreorigformatting}{%
    \LWR@traceinfo{LWR@restoreorigformatting}%
```

Numerous macros change their print/HTML meaning depending on `\LWR@formatting`:

```

82 Nullifying filename formatting

The following are used to nullify certain macros and environments while converting section names to file names.

for HTML output:

```
\begin{warpHTML}

Also commonly used are `\@empty`, `\@gobble`, and `\@firstofone`.

```
\newcommand*{\LWR@dash}{-}

83 Math

83.1 Limitations

See Math, section 8.7.

83.2 HTML `alt` tag names

Redefinable names for the HTML `alt` tags, for translation according to the reader's native language.

for HTML & PRINT:

```
\begin{warpall}
```

`\AltTextOpen` The opening part of HTML `alt` tag for an image. The default is a left parenthesis.
Default: (

```
\newcommand*{\AltTextOpen}{(}
```

`\AltTextClose` The closing part of HTML `alt` tag for an image. The default is a right parenthesis.
Default: (

```
\newcommand*{\AltTextClose}{)}
```

`\ImageAltText` The HTML `alt` tag for an image.
Default: image

```
\newcommand*{\ImageAltText}{image}
```

\MathImageAltText — The HTML alt tag for an SVG math image.
Default: "math image"

```
\newcommand*{\MathImageAltText}{math image}
```

\LWR@ThisAltText — The HTML alt tag for the next image. Cleared after use, and also after each lateximage, \LWR@subsingledollar, and each use of MathJax.

```
\newcommand*{\LWR@ThisAltText}{}
```

\ThisAltText {⟨*text*⟩}

Assigns the HTML alt tag for the next image generated by lwarp, such as a lateximage, picture, or SVG math.

```
\newcommand*{\ThisAltText}[1]{%
    \renewcommand{\LWR@ThisAltText}{#1}%
}
```

\PackageDiagramAltText — Appended to the lateximage HTML alt tag for the images generated by many packages.
Default: "diagram"

```
\newcommand*{\PackageDiagramAltText}{diagram}
```

```
\end{warpall}
```

83.3 Inline and display math

for HTML output:

```
\begin{warpHTML}
```

Ctr LWR@externalfilecnt — Counter for the external files which are generated and then referenced from the HTML:

```
\newcounter{LWR@externalfilecnt}
```

Bool LWR@indisplaymathimage — True if processing display math for SVG output. Inside a lateximage, display math is only set to print-mode output if LWR@indisplaymathimage is false. Used to avoid nullifying display math before it has been completed.

```
\newbool{LWR@indisplaymathimage}
```

Bool LWR@insidemathcomment — True while inside an HTML comment which is displaying a math environment. Used to undo the comment for a moment while creating a \label, so that the label's HTML tags will be seen by HTML.

```
\newbool{LWR@insidemathcomment}
\boolfalse{LWR@insidemathcomment}
```

Bool LWR@xfakebold — True if xfakebold \setBold is in use.

```
\newbool{LWR@xfakebold}
\boolfalse{LWR@xfakebold}
```

\LWR@orig@setBold Redefined by lwarp-xfakebold.

```
\newcommand*{\LWR@orig@setBold}{}

\LWR@orig@unsetBold Redefined by lwarp-xfakebold.

```
\newcommand*{\LWR@orig@unsetBold}{}
```

\LWR@applyxfakebold Redefined by lwarp-xfakebold.

```
\newcommand*{\LWR@applyxfakebold}{}
```

\LWR@setcurrentfont Sets the actual LaTeX font to that which was selected for HTML output. Ex: In HTML mode, \bfseries sets \LWR@f@series to "bf". This sets the PDF output here for use inside a lateximage.

```
\newcommand*{\LWR@setcurrentfont}{%
    \LWR@traceinfo{Using font family \LWR@f@family}%

File lwarp_baseline_marker.png
File lwarp_baseline_marker.eps

A marker to be used to help *pdfcrop* identify the inline math baseline and width. If either graphicx or graphics is loaded, this marker is placed at the lower left and lower right corners of the inline math. *pdfcrop* is then able to identify the width of the image, and also the height of an image such as a horizontal dash which does not otherwise touch the baseline.

A marker with alpha or opacity of 0% is not registered by *pdfcrop*, so the marker is a small square block of 1% alpha, which seems to work while still being effectively invisible in the final SVG image.

If graphicx is loaded, this marker is sized as a tiny 1 sp square. If graphics is loaded, this marker is used at its default size of around .25 pt. If neither graphics package is loaded, the marker is replaced by a 10 sp horizontal space, and there is no assistance for determining baseline or width of the inline math image. The best results are obtained when using graphicx.

\LWR@addbaselinemarker Places a small marker in an SVG inline image. If graphics or graphicx are loaded, the marker is a mostly transparent image. If neither is loaded, no marker is used.

Bool LWR@unknownmathsize

If Ti*k*z or other objects are used inside math mode, the resulting image may exceed the TEX box, resulting in an incorrect measurement of the size of the resulting image. If this is so, the HTML styles for image size and depth will be neutralized.

```

\LWR@singledollarmeasure {⟨*math expression*⟩}

Measures the size of the image of the math expression.

(In some circumstances SVG math is used even if MATHJAX is preferred.)

SVG math: \LWR@origensuredmath is part of argument #4.

SVG math \ensuremath: \LWR@origensuredmath is part of argument #4.

Add a small and almost transparent marker at the depth of the image.

Measure the depth, width, and height of the math image:

```
    \LWR@singledollarmeasure{#4}%
```

Set a style for the the height or width. The `em` unit is used so that the math scales according to the user's selected font size.

Start with the greater of the width or the height, biased towards the width:

```
    \ifdimgreater{\LWR@singledollarwidth}{.7\LWR@singledollarheight}{%
        \def\LWR@singledollarstyle{%
            width:\LWR@convertto{em}{\the\LWR@singledollarwidth} em%

            height:\LWR@convertto{em}{\the\LWR@singledollarheight} em%
        }%
    }%
```

If a very narrow width, use the height.

```
    \ifdimless{\LWR@singledollarwidth}{.2em}%
    {%
        \def\LWR@singledollarstyle{%
            height:\LWR@convertto{em}{\the\LWR@singledollarheight} em%
        }%
    }%
    {}%
```

If very wide and short, use the width:

```
    \ifdimless{\LWR@singledollarheight}{.2em}%
    {%
        \def\LWR@singledollarstyle{%
            width:\LWR@convertto{em}{\the\LWR@singledollarwidth} em%
        }%
    }%
    {}%
```

If there is significant text depth, add the depth to the style.

```
    \ifdimgreater{\LWR@singledollardepth}{0.05ex}{%
        \def\LWR@singledollardepthstyle{%

image filename hashing If starred, a hashed filename is used.If so, the hash is based on the `alt` tag and also the additional hashing argument.

This may be used to provide an expression with a simple `alt` tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated TEX expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is used in the additional hashing argument to ensure a unique image.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple `alt` tag is still the same.

MathJax cannot parse the often complicated TEX expressions which appear in the various uses of `\ensuredmath`. `\ensuremath` forces the `alt` tag to "`(math image)`", as translated according to `\MathImageAltText`. If this is the case, force the use of a `lateximage` even if MathJax. Likewise for siunitx if `parse-numbers=false`.

83.6 \displaymathnormal and \displaymathother

\displaymathnormal By default, or when selecting \displaymathnormal, MathJax math display envi-

ronments print their contents as text into HTML for MathJax to interpret, and SVG display math environments render their contents as SVG images and use their contents as the `alt` tag of HTML output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated Ti*k*z pictures, compilation will fail.

`\displaymathother`
MathJax unsupported complicated `alt` tag

When selecting `\displaymathother`, it is assumed that the contents are more complicated than "pure" math. An example is an elaborate Ti*k*z picture, which will not render in MathJax and will not make sense as an HTML `alt` tag. In this mode, MathJax is turned off, math display environments become SVG images, even if MathJax is selected, and the HTML `alt` tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as Ti*k*z pictures are more likely to compile successfully.

`\displaymathnormal`
simple math objects

Use when display math environments have simple math which is to sent to MathJax or included in HTML `alt` tags.

```
\newcommand*{\displaymathnormal}{%
    \ifbool{LWR@origmathjax}{\booltrue{mathjax}}{\boolfalse{mathjax}}%
    \LetLtxMacro\[\LWR@openbracketnormal%
    \LetLtxMacro\]\LWR@closebracketnormal%

    \csletcs{equation*}{LWR@equationnormalstar}%
    \csletcs{endequation*}{LWR@endequationnormalstar}%
}
```

`\displaymathother`
complicated math objects

Use when display math environments have complicated objects which will not work with MathJax or should not be included in HTML `alt` tags. Complicated contents are more likely to compile correctly.

```
\newcommand*{\displaymathother}{%
    \boolfalse{mathjax}%
    \LetLtxMacro\displaymath\LWR@displaymathother%
    \LetLtxMacro\enddisplaymath\endLWR@displaymathother%

83.7 AMS Math environments

83.7.1 Support macros

Bool LWR@amsmultline

True if processing a multline environment.

To compensate for multline-spefific code, LWR@amsmultline is used to add extra horizontal space in \LWR@htmlmathlabel if is used in an amsmath environment which is not a multline environment and not an equation.

    \LWR@orignewline
    \LWR@startpars
}
```

83.7.2 Environment patches

The amsmath environments already collect their contents in \@envbody for further processing. eqnarray is not an $\mathcal{AMS}$ package, and thus requires special handling.

For SVG math: Each envrionment is encapsulated inside a lateximage environment, along with a special optional argument of \LWR@amsmathbody or \LWR@amsmathbodynumbered telling lateximage to use as the HTML <alt> tag the environment's contents which were automatically captured by the $\mathcal{AMS}$ environment.

For MathJax: Each environment is synched with LaTeX's equation numbers, typeset with LaTeX inside an HTML comment, then printed to HTML output for MathJax to process.

Env eqnarray This environmnet is not an $\mathcal{AMS}$ environment and thus its body is not automatically captured, so the environ package is used to capture the environment into \BODY.

```
\let\LWR@origeqnarray\eqnarray
\let\LWR@origendeqnarray\endeqnarray
```

To remember whether the starred environment was used, and thus whether to number the equations:

```
\newbool{LWR@numbereqnarray}
\booltrue{LWR@numbereqnarray}
```

Common code used by eqnarray and Beqnarray (from fancybox):

```
\newcommand{\LWR@eqnarrayfactor}{%
```

If mathjax or FormatWP, print the LaTeX expression:

```
    \ifboolexpr{bool{mathjax} or ( bool{FormatWP} and bool{WPMarkMath} ) }%
    {%
```

If MathJax, the environment contents (the \BODY) are executed in a HTML comment to trigger the correct equation number increment (if not starred), then are included verbatim in the output for MathJax to interpret:

```
        \LWR@syncmathjax%
        \boolfalse{LWR@amsmultline}%
        \ifbool{LWR@numbereqnarray}%
        {%
```

If numbering the equations, execute a copy inside an HTML comment block:

```
            \LWR@beginhideamsmath%
            \LWR@origeqnarray%
            \BODY%
            \LWR@origendeqnarray%
            \LWR@endhideamsmath%
```

Then print the (sanitized) contents to the output for MathJax to interpret:

```
            \LWR@addmathjax{eqnarray}{\BODY}%
        }%
        {% not LWR@numbereqnarray
```

If not numbering equations, just create the contents for MathJax:

```
            \LWR@addmathjax{eqnarray*}{\BODY}%
        }% LWR@numbereqnarray
    }% mathjax
    {% not mathjax
        \ifbool{LWR@numbereqnarray}%
        {%
```

For numbered SVG equations, first create a lateximage with an alt attribute containing sanitized copy of the source code:

```
            \begin{BlockClass}{displaymathnumbered}%
            \LWR@newautoidanchor%
            \booltrue{LWR@indisplaymathimage}%
        \begin{lateximage}[(\LWR@startingequationtag\textendash\LWR@equationtag)%
                \LWR@addmathjax{eqnarray}{\BODY}]*(math)%
```

Support for xfakebold:

```
            \LWR@applyxfakebold%
```

Create the image contents using an actual eqnarray:

```
            \LWR@origeqnarray%
            \BODY%
            \LWR@origendeqnarray%
            \end{lateximage}%
            \end{BlockClass}%
        }%
        {% not LWR@numbereqnarray
```

If not numbered, do the same, but an extra \nonumber seems to be required:

```
            \begin{BlockClass}{displaymath}%
            \LWR@newautoidanchor%
            \booltrue{LWR@indisplaymathimage}%
            \begin{lateximage}[\LWR@addmathjax{eqnarray*}{\BODY}]*(math)%
```

Support for xfakebold:

```
            \LWR@applyxfakebold%

            \def\@eqncr{\nonumber\@seqncr}
            \csuse{LWR@origeqnarray}%
            \BODY%
            \nonumber\csuse{LWR@origendeqnarray}%
            \end{lateximage}%
            \end{BlockClass}%
        }% LWR@numbereqnarray
    }% not mathjax
```

Default to number equations in the future:

```
    \booltrue{LWR@numbereqnarray}%
```

Clear the single-use alt text:

```
    \gdef\LWR@ThisAltText{}%
}
```

eqnarray itself is made with a blank line before and after to force it to be on its own line:

```
\RenewEnviron{eqnarray}
{%

\LWR@eqnarrayfactor

}
```

The starred version is patched to turn off the numbering:

```
\csgpreto{eqnarray*}{\boolfalse{LWR@numbereqnarray}}
\end{warpHTML}
```

84 Lateximages

84.1 Description

Env lateximage

A lateximage is a piece of the document which is typeset in LaTeX then included in the HTML output as an image. This is used for math if SVG math is chosen, and also for the picture, tikzpicture, and other environments.

Before typesetting the lateximage a large number of formatting, graphics, and symbols-related macros are temporarily restored to their print-mode meaning by \LWR@restoreorigformatting. (See section 81.)

A lateximage is typeset on its own PDF page inside an HTML comment which starts on the preceeding page and ends on following page, and instructions are written to lateximage.txt for *lwarpmk* to extract the lateximage from the page of the PDF file then generate an accompanying .svg file image file. Meanwhile, instructions to show this image are placed into the HTML file after the comment.

An HTML is created to hold both the HTML comment, which will have the *pdftotext* conversion, and also the link to the final .svg image.

A LaTeX label is used to remember which PDF page has the image. A label is used because footnotes, endnotes, and pagenotes may cause the image to appear at a later time. The label is declared along with the image, and so it correctly remembers where the image finally ended up.

HTML alt tag

The HTML alt tag is set to the LaTeX source for SVG math, some chemistry expressions, and perhaps some other expressions which make sense for text copy/paste. In some other cases, the alt tag is set according to the package name.

When creating an SVG math image, its HTML alt tag may be set to the math expression, which may be hashed for image reuse. In the case of \ensuremath or after \inlinemathother, where the contents require a unique image for each instance of the same expression, the alt tag is set to \MathImageAltText, along with \AltTextOpen and \AltTextClose, and the image is not reused.

This alt expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "math image", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following SVG math images.

For many packages, the output is placed inside a lateximage with an HTML alt tag set to the package name followed by \PackageDiagramAltText. For example:

```
(-xy- diagram)
```

This expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "diagram", and may it be changed ac-

cording to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following package diagrams.

SVG image font size

For the `lateximage` environment, the size of the math and text used in the SVG image may be adjusted by setting `\LateximageFontSizeName` to a font size name — *without the backslash*, which defaults to:

```
\renewcommand{\LateximageFontSizeName}{normalsize}
```

For inline SVG math, font size is instead controlled by `\LateximageFontScale`, which defaults to:

```
\newcommand*{\LateximageFontScale}{.75}
```

84.2 Support counters and macros

84.3 Font size

for HTML & PRINT:

```
\begin{warpall}
```

`\LateximageFontSizeName`

Declares how large to write text in `\lateximages`. The `.svg` file text size should blend well with the surrounding HTML text size.

⚠ no backslash

Do not include the leading backslash in the name.

```
\newcommand*{\LateximageFontSizeName}{normalsize}
```

\LateximageFontScale Declares how large to scale inline SVG math images. The .svg file text size should blend well with the surrounding HTML text size. The default is 1, but it may be redefined as needed depending on the HTML font.

```
\newcommand*{\LateximageFontScale}{1}
\end{warpall}
```

84.4 Equation numbers

for HTML output:

```
\begin{warpHTML}
```

Ctr LWR@startingequation For use with lateximage and multi-line numbered equations. Remembers the next equation number so that it may be printed in the alt tag.

```
\newcounter{LWR@startingequation}

\renewcommand{\theLWR@startingequation}{%

```

Bool LWR@isstartingequation True for the first equation tag, false for later tags in the same environment.

```
\newbool{LWR@isstartingequation}
```

\LWR@startingequationtag Prints the starting equation number or tag.

```
\let\LWR@startingequationtag\theLWR@startingequation

\LWR@equationtag Prints the ending equation number or tag.

This is reset by lateximage, may be temporarily overwritten by \tag calling \LWR@remembertag.

```
\newcommand*{\LWR@equationtag}{}

Only if SVG math, patch \tag after packages have loaded, in case someone else modified \tag.

```

84.5 HTML alt tags

\LWR@amsmathbody {⟨*envname*⟩} For use inside the optional argument to a lateximage to add the contents of a AMS math environment to the <alt> tag.

```
\newcommand*{\LWR@amsmathbody}[1]

```

84.6 lateximage environment

\LWR@lateximage@oneimageb {⟨*1: alt text*⟩} {⟨*2: filename*⟩} {⟨*3: css style*⟩} {⟨*4: aria role*⟩} Creates the image for the lateximage.

```
\newcommand{\LWR@lateximage@oneimageb}[4]{%
    \LWR@subinlineimage{#1}{lateximage}%
    {%

    }{svg}{#3}{#4}%
}
```

\LWR@lateximage@oneimage {⟨*1: alt text*⟩} {⟨*2: filename*⟩} {⟨*3: css style*⟩} {⟨*4: delimit?*⟩} {⟨*5: aria role*⟩}

Creates an image for the lateximage, whose alt text depends on the circumstances.

```
\newcommand{\LWR@lateximage@oneimage}[5]{%
    \LWR@traceinfo{LWR@lateximage@oneimage !#1!#2!#3!#4!#5!}%
    \ifdefvoid{\LWR@ThisAltText}{%

        }{%
            \LWR@lateximage@oneimageb%
                {\AltTextOpen#1\AltTextClose}%
                {#2}{#3}{#5}%
        }%
    }{%
        \LWR@lateximage@oneimageb%
            {\AltTextOpen\LWR@ThisAltText\AltTextClose}%
            {#2}{#3}{#5}%
    }%
}
```

Env lateximage * [⟨*2:* <alt> *tag*⟩] * [⟨*4: add'l hashing*⟩] [⟨*5: css style*⟩] (⟨*6: aria role*⟩)

Typesets the contents and then renders the result as an SVG file. Star #1 causes the image to be hashed for reuse. Star #3 causes the alt tag to not include \AltTextOpen and \AltTextClose, for use with math expressions.

The optional <alt> tag is included in the HTML code for use with copy/paste.

image filename hashing

If starred, a hashed filename is used.If so, the hash is based on the alt tag and also the additional hashing argument.

This may be used to provide an expression with a simple alt tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated TEX expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is used in the additional hashing argument to ensure a unique image.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple alt tag is still the same.

File *_html.aux

A new label is placed into the file *_html.aux:

```
\newlabel{LWRlateximage-<BaseJobname>-<number>}{{<x>}{<y>}}
```

This is used to find the image in the PDF file, according to its name.

File *-images.txt

A list of images to generate is created in <jobname>-images.txt. Each line has three pipe-delimited fields, containing the PDF page number from <jobname>_html.pdf, where the image is located, a boolean indicating whether the image is hashed, and the filename of the image. The last line has "end" in each field, and is used to detect an incomplete compile.

```
\catcode`\$=\active%

12422 \LWR@traceinfo{lateximage: entering depth is \arabic{LWR@lateximagedepth}}%
```

Nested lateximages remain one large lateximage:

```
12423 \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
```

If nesting inside an already-existing lateximage, simply record one more level. $\mathcal{AMS}$ packages redefine \addtocounter to do nothing if inside a \text, so lower-level TEX macros are used for tracking nested lateximages.

```
12424 {%
12425 %     \addtocounter{LWR@lateximagedepth}{1}%
12426     \global\advance\c@LWR@lateximagedepth 1\relax% Due to AmS \text macro.
12427 }%
```

Otherwise, this is the outer-most lateximage:

```
12428 {% start of outer-most lateximage
```

Remember the next equation number to be allocated, in case it must be printed in a multi-equation environment:

```
12429     \LWR@traceinfo{lateximage: starting outer-most lateximage}%
12430     \setcounter{LWR@startingequation}{\value{equation}}%
12431     \addtocounter{LWR@startingequation}{1}%
12432     \booltrue{LWR@isstartingequation}%
12433     \let\LWR@startingequationtag\theLWR@startingequation%
```

The default equation tag, unless overwritten by \tag:

```
12434     \let\LWR@equationtag\theequation%
```

Starting a new lateximage:

```
12435     \addtocounter{LWR@lateximagenumber}{1}%
12436    \LWR@traceinfo{lateximage: LWR@lateximagenumber is \arabic{LWR@lateximagenumber}}%
```

While inside a lateximage, locally do not use mathjax:

```
12437     \boolfalse{mathjax}%
```

Be sure that are doing a paragraph:

```
12438     \LWR@ensuredoingapar%
```

Inside the lateximage, temporarily prevent underfull \hbox warnings.

```
12439     \hbadness=10000\relax%
```

Next file:

```
12440     \addtocounter{LWR@externalfilecnt}{1}%
12441    \LWR@traceinfo{lateximage: LWR@externalfilecnt is \arabic{LWR@externalfilecnt}}%
```

Figure out what the next page number will be. \setcounterpageref assigns LWR@LIpage to the page number for the reference LWRlateximage-BaseJobname-XXX:

```
    \setcounterpageref{LWR@LIpage}{%
        LWRlateximage-\BaseJobname-\arabic{LWR@lateximagenumber}%
    }%
    \LWR@traceinfo{lateximage: LWR@LIpage is \arabic{LWR@LIpage}}%
```

Create an HTML span which will hold the comment which contains the *pdftotext* translation of the image's page, and also will hold the link to the .svg file:

```
    \LWR@htmltag{span\LWR@indentHTML%
        id=\textquotedbl{}%
            lateximage-\BaseJobname-\arabic{LWR@lateximagenumber}%
            \textquotedbl\LWR@indentHTML
        class=\textquotedbl{}lateximagesource\textquotedbl\LWR@orignewline
    }%
```

Write instructions to the <ImagesDirectory>.txt file:

```
    \LWR@traceinfo{lateximage: about to write to \BaseJobname-images.txt}%
    \IfBooleanTF{#1}% starred
    {% hash
```

Compute and save the hashed file name for later use:

```
        \ifdefvoid{\LWR@ThisAltText}{%
            \IfBooleanTF{#3}{%
                \edef\LWR@hashedname{%
                    \LWR@mdfive{\detokenize\expandafter{#2}-!-#4}%
                }%
            }{%
                \edef\LWR@hashedname{%
                 \LWR@mdfive{\detokenize\expandafter{\AltTextOpen#2\AltTextClose}-!-#4}%
                }%
            }%
        }{%
            \edef\LWR@hashedname{%
              \LWR@mdfive{\detokenize\expandafter{\AltTextOpen\LWR@ThisAltText\AltTextClose}-!-#4}%
            }%
        }%
        \LWR@traceinfo{lateximage: hash is \LWR@hashedname}%
```

Write the page, hashing, and hashed name:

```
        \immediate\write\LWR@lateximagesfile{%
            |\arabic{LWR@LIpage}|true|\LWR@hashedname|%
        }%
    }% hash
    {% no hash
```

No hash, so write the page, no hashing, and the image number:

```
        \LWR@traceinfo{lateximage: hash false}%
        \immediate\write\LWR@lateximagesfile{%
        |\arabic{LWR@LIpage}|false|\LWR@ImagesName\arabic{LWR@externalfilecnt}|%
        }%
    }% no hash
```

Place an open comment tag. This will hide any traces of the lateximage PDF page which were picked up by *pdftotext*.

```
    \LWR@traceinfo{lateximage: about to create open comment}%
    \LWR@htmlopencomment%
```

One level deeper. At this outer-most `lateximage`, it is known that this is not being used inside an $\mathcal{AMS}$ `\text`, since the outer-most level will never be in math mode.

```
     \addtocounter{LWR@lateximagedepth}{1}%
```

Start the new PDF page:

```
    \LWR@traceinfo{lateximage: about to create a new page}%

If the current page is larger, typeset the image in a "standard" width page and font size:

```
    \LWR@traceinfo{lateximage: about to create minipage}%
    \setcounter{LWR@mpfootnote@store}{\value{mpfootnote}}
    \ifdimless{\linewidth}{6in}{%
        \LWR@print@minipage{\linewidth}%

        {\setcounter{mpfootnote}{\value{LWR@mpfootnote@store}}}%
        {}%
    \@nameuse{LWR@print@\LateximageFontSizeName}%
```

Temporarily restore formatting to its PDF definitions: Do not produce HTML tags for `\hspace`, etc. inside a lateximage.

```
    \LWR@traceinfo{lateximage: about to temporarily restore formatting}%
    \LWR@restoreorigformatting%

If not inside a `minipage`, use full-page footnotes instead of minipage footnotes. These become HTML footnotes.

```

   \LWR@orig@label{LWRlateximage-\BaseJobname-\arabic{LWR@lateximagenumber}}%
    \LWR@traceinfo{lateximage: finished creating the label}%

Adjust the rule color to match HTML:

```
    \ifdefvoid{\LWR@ruleHTMLcolor}{}{%
        \LWR@print@arrayrulecolor[HTML]{\LWR@ruleHTMLcolor}%

Enable print-mode math functions:

    \catcode`\$=3% math shift
    \LetLtxMacro\(\LWR@origopenparen%

Only enable print-mode display math if are not already inside display math:

```
    \ifbool{LWR@indisplaymathimage}{}{% not in display math
        \LetLtxMacro\[\LWR@origopenbracket%

\LWR@traceinfo{lateximage: finished start of environment}%
}% end of \begin{lateximage}
```

\endlateximage When the lateximage environment closes:

```
{% start of \end{lateximage}
\LWR@traceinfo{lateximage: starting end of lateximage}%
```

Nested more than one deep?

```
\LWR@traceinfo{lateximage: internal depth was \arabic{LWR@lateximagedepth}}%
\ifnumcomp{\value{LWR@lateximagedepth}}{>}{1}%
```

If nesting inside an already existing lateximage, simply record one less level. Uses a lower-level TEX macro due to $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ \text change of \addtocounter.

```
{%
    \LWR@traceinfo{lateximage: unnesting}%
    \global\advance\c@LWR@lateximagedepth -1\relax%
}%
```

If this is the outer-most lateximage:

```
{% end of outer-most lateximage

Finish the lateximage minipage and start a new PDF page:

```
\LWR@traceinfo{lateximage: ending outer-most lateximage}%
    \endLWR@print@minipage%
    \LWR@maybe@orignewpage%
```

Close the HTML comment which encapsulated any traces of the lateximage picked up by *pdftotext*:

```
    \LWR@print@vspace*{.5\baselineskip}%
    \LWR@htmlclosecomment%
    \LWR@traceinfo{lateximage: The page after the image is \arabic{page}}%
```

Create a link to the lateximage, allowing its natural height:

```
    \LWR@traceinfo{about to LWR@lateximage@oneimage !#2!}%
    \IfBooleanTF{#1}% starred
    {% hash
        \LWR@lateximage@oneimage{#2}{\LWR@hashedname}{#5}{#3}{#6}%

    {% no hash
     \LWR@lateximage@oneimage{#2}{\LWR@ImagesName\theLWR@externalfilecnt}{#5}{#3}{#6}%
    }% no hash
```

Be sure that are doing a paragraph:

```
    \LWR@ensuredoingapar%
```

Close the HTML span which has the *pdftotext* comment and also the link to the `.svg` image:

```
    \LWR@htmltag{/span}%
    \ifbool{HTMLDebugComments}{%
        \LWR@htmlcomment{End of lateximage}%
    }{}%
```

Undo one lateximage level. This is not inside an $\mathcal{AMS}$ `\text`, so regular `\addtocounter` may be used here.

```
    \addtocounter{LWR@lateximagedepth}{-1}%
```

Clear the single-use `alt` text:

```
    \gdef\LWR@ThisAltText{}%
}% end of outer-most lateximage

87 siunitx

Pkg siunitx

A few HTML unit equivalents are defined here.

siunitx is well supported by lwarp.

Limitations Some general limitations:

fractions Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

`\cancel` is not currently supported for siunitx v3.

Negative values are not automatically colored.

⚠ tabular Tabular `S` and `s` columns are rendered as simple `c` columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for

⚠ drop-exponent `drop-exponent`, without which the value will be shown incorrectly.

⚠ table-auto-round `table-auto-round` is ignored.

Math rendering Math may be rendered in several ways in the same document:

For math mode with SVG display: The original siunitx code is used while generating the SVG image.

For HTML text mode: lwarp uses siunitx code patched for HTML, and simplified units.

For math expressions while using MathJax: A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

Custom units siunitx allows customized units:

`\DeclareSIUnit` {⟨*name*⟩} {⟨*definition*⟩}

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in SVG math or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

`\HTMLDeclareSIUnit` {⟨*name*⟩} {⟨*definition*⟩}

⚠ v3 only! Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit` declares a simplified version of the unit for HTML, for example if the print-mode unit uses TEX boxes or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MathJax:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

Predefined units Most units work as-is with HTML. For the following units, lwarp has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

⚠ MathJax

Document modifications required for MathJax

⚠ `\sisetup`
- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MathJax. The MathJax emulation also ignores most macro options.

⚠ complex numbers
- Complex numbers are displayed as entered, ignoring `output-complex-root`.

custom units
- Custom units may be added with `\CustomizeMathJax`. For example, from lwarp-common-mathjax-siunitx:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_{\mathrm{h}}}}
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

⚠ unit spacing
- Units work better using ~ between units instead of using periods.

⚠ `\square, \cubic`
- To square or cube compound units, enclose the following compound units in braces:

```
\cubic{\centi\meter}
```

  Single units do not require braces.

- For `\numlist`, the argument is printed as text as-is, so use space between semicolons for improved readability.

⚠ `Missing $ inserted`
- If using `parse-numbers = false`, also use `\num` or `\qty`. siunitx=siunitx>Missing $ inserted.

Also see MathJax option, section 8.7.4.

88 Graphics print-mode modifications

88.1 General limitations

file extensions

Per table 9, image filenames may be specified either with or without an extension. If an extension is given it will be used as-is, for either print or HTML output. If no extension is given, a list of possible extensions is tried, which depends on whether print or HTML is being generated. This allows a PDF file for print and a SVG file for HTML, for example. If no extension is given, the automatic search will only return lowercase extensions, even if the filename actually has an uppercase extension, and lwarp cannot get around this problem, so image file extensions must be lowercase to be seen by the HTML browser with lwarp. For example, name the image file `image.pdf` instead of `image.PDF`, but refer to it in the source as `image`, without an extension. For images which may be used as-is with either print or HTML, such as JPG or PNG, you may use a capitalized extension if it is specified in the source, such as `image.JPG`.

⚠ case sensitive

`\includegraphics` file formats

For `\includegraphics` with `.pdf` or `.eps` files, the user must provide a `.pdf` or `.eps` image file for use in print mode, and also a `.svg`, `.png`, or `.jpg` version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, lwarp will automatically choose the `.pdf` or `.eps` format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a `.pdf` or `.eps` image is referred to with its file extension, the extension will be changed to `.svg` for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html
\includegraphics{filename.eps} % uses .svg in html
```

Prog pdftocairo

PDF to SVG

To convert a PDF image to SVG, use the utility *pdftocairo*:

Enter ⇒ **pdftocairo -svg filename.pdf**

Prog lwarpmk pdftosvg

For a large number of images, use *lwarpmk*:

Enter ⇒ **lwarpmk pdftosvg *.pdf** **(or a list of filenames)**

Prog lwarpmk epstopdf

Prog epstopdf

epstopdf package

For EPS images converted to PDF using the package epstopdf, use

Enter ⇒ **lwarpmk pdftosvg *.PDF**

to convert to SVG images.

DVI LaTeX

When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ **lwarpmk epstopdf *.eps** **(or a list of filenames)**

Enter ⇒ **lwarpmk pdftosvg *.pdf** **(or a list of filenames)**

PNG and JPG

For PNG or JPGwhile using *pdflatex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

GIF

GIF files may be used for HTML, but another format must also be provided for print output.

file extension priorities

If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

duplicate files

⚠ image not displayed

A complication occurs if a file of the same name exists elsewhere in the TeX tree, such as a test image from some LaTeX package. TeX looks in the local document directory before considering the directories specified by `\graphicspath`, but the TeX tree is found as "local", so any file in the tree is found before the directories in `\graphicspath`. To use such an image, it must be copied to the document's directory to be used for HTML, and furthermore must be in the document's base directory instead of an images subdirectory.

⚠ graphics vs. graphicx

⚠ viewport

If using the older graphics syntax, use both optional arguments for `\includegraphics`. A single optional parameter is interpreted as the newer graphicx syntax. Note that viewports are not supported by lwarp — the entire image will be shown.

units

For `\includegraphics`, avoid `px` and `%` units for width and height, or enclose them inside `warpHTML` environments. For font-proportional image sizes, use `ex` or `em`. For fixed-sized images, use `cm`, `mm`, `in`, `pt`, or `pc`. Use the keys `width=.5\linewidth`, or similar for `\textwidth` or `\textheight` to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the `scale` option, since it is not well supported by HTML browsers.

options

`\includegraphics` accepts `width` and `height`, `origin`, `rotate` and `scale`, plus new `class` and `alt` keys. (`alt` has recently been incorportated into graphicx itself.)

HTML class

With HTML output, `\includegraphics` accepts an optional `class=xyz` keyval combination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

HTML alt tags

Likewise, the \includegraphics alt key adds an HTML alt tag to an image, and is ignored for print output. If not assigned, each image is given an alt tag according to \ImageAltText.

⚠ scale

Avoid using the \includegraphics scale option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

\rotatebox

\rotatebox accepts the optional origin key.

⚠ browser support

\rotatebox, \scalebox, and \reflectbox depend on modern browser support. The css3 standard declares that when an object is transformed the whitespace which they occupied is preserved, unlike LaTeX, so expect some ugly results for scaling and rotating.

88.2 Print-mode modifications

for PRINT output:

For print output, accept and then discard the new class key:

```
\begin{warpprint}
\define@key{Gin}{class}{}
```

Print-mode additions for the overpic package. See section 460 for the HTML version.

```

89 xcolor boxes

Pkg xcolor

A few new definitions are provided for enhanced HTML colored boxes, and \fcolorbox is slightly modified. Print-mode version are also provided.

Print-mode versions of new xcolor defintions. These are defined inside warpall because they are also used for HTML while inside a lateximage. They are defined \AtBeginDocument so that the xcolor originals may first be loaded and saved for reuse.

The framed versions are modified to allow a background color of none, in which case only the frame is drawn, allowing the background page color to show.

for HTML & PRINT:

```
\begin{warpall}

… and *only* if xcolor was loaded:

```
\IfPackageLoadedTF{xcolor}{

The print version:

\colorboxBlock `\colorboxBlock` is the same as `\colorbox`:

```

The original definition is reused by the new versions:

```
\LetLtxMacro\LWR@orig@print@fcolorbox\fcolorbox
```

\fcolorbox `[⟨framemodel⟩] {⟨framecolor⟩} [⟨boxmodel⟩] {⟨boxcolor⟩} {⟨text⟩}`

In print mode, `\fcolorbox` is modified to accept a background color of none.

90 chemmacros environments

`\makepolymerdelims` and redox reactions must be enclosed in a `lateximage` during HTML output. These environments are provided here in print mode, and in the chemmacros code in HTML mode, as a high-level semantic syntax which automatically embeds the contents in a `lateximage` with an appropriate `alt` tag.

for PRINT output:

```
\begin{warpprint}

\AtBeginDocument{
\IfPackageLoadedTF{chemmacros}{
```

Env `polymerdelims`

```
\DeclareDocumentEnvironment{polymerdelims}{}
    {}{}
```

Env `redoxreaction` {⟨*space above*⟩} {⟨*space below*⟩}

For print output, extra space is include above and below the image, and a `lateximage` is not necessary. This extra space must be enforced, even inside a float, so zero-width rules are used.

For the HTML version, see section 193.5.

```
\DeclareDocumentEnvironment{redoxreaction}{m m}
    {\rule{0pt}{#1}}{\rule[-#2]{0pt}{#2}}

}{}% chemmacros
}% AtBeginDocument

\end{warpprint}
```

91 cleveref

loading order

cleveref and lwarp-cleveref with its associated macro patches are automatically preloaded at the end of the preamble via `\AtEndPreamble` and `\AfterEndPreamble`. This is done because the HTML conversion requires cleveref. The user's document may not require cleveref, thus the user may never explicitly load it, so during HTML output lwarp loads it last. If the user's document preamble uses cleveref options, or functions such as `\crefname`, then cleveref may be loaded in the user's preamble near the end, and lwarp's additional loading of cleveref will have no effect.

`\AtEndPreable` forces cleveref to be loaded last, if it has not yet been loaded by the user.

for HTML output:

```
\begin{warpHTML}

\AtEndPreamble{
    \RequirePackage{cleveref}
}

\end{warpHTML}
```

92 Preexisting label and reference definitions

Remember and patch some label-related defintions. These will be further encased and patched by other packages later.

`\label` and `\pageref` do NOT change their behavior according to print or HTML output, and thus do not use the `\LWR@formatted` system.

for HTML output:

```
\begin{warpHTML}

\LetLtxMacro\LWR@orig@label\label% includes memoir, before cleveref
\LetLtxMacro\label\LWR@new@label

94 Minipages and Boxes

A css flexbox is used for minipages and parboxes, allowing external and internal vertical positioning.

⚠ inline

A line of text with an inline minipage or \parbox will have the minipage or \parbox placed onto its own line, because a paragraph is a block element and cannot be made inline-block.

placement

minipages and \parboxes will be placed side-by-side in HTML unless you place a \newline between them.

side-by-side

Side-by-side minipages may be separated by \quad, \qquad, \enskip, \hspace, \hfill, or a \rule. When inside a center environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side minipages and these spacing commands, but not at the start or end of the paragraph.

⚠ minipage in a span

There is limited support for minipages inside an HTML . An HTML cannot appear inside a . While in a , minipages, and \parboxes, and any enclosed lists have limited HTML tags, resulting in an "inline" format, without markup except for HTML breaks. Use \newline or \par for an HTML break.

⚠ minipage size

When using minipage, \parbox, and fminipage, a virtual 6×9 inch text area is used for \linewidth, \textwidth, and \textheight, both for sizing the minipage, and also for its contents.

if width is \linewidth

If a minipage or \parbox is assigned a width of exactly \linewidth, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it appears in print output.

full-width if HTML

A new macro \minipagefullwidth requests that, during HTML output, the next single minipage or \parbox be generated without an HTML width attribute, allowing it to be the full width of the display rather than the declared print-output width. This may be useful where the printed version's width makes no sense in HTML.

⚠ tabular, multicols

\UseMinipageWidths
\IgnoreMinipageWidths

Inside a tabular or multicols environment, where the width depends on the browser window, \minipagefullwidth is effectively used by default for every minipage or \parbox inside the environment. \UseMinipageWidths may be used to tell lwarp to honor the specified widths of all following minipages and \parboxes

until the end of the local scope, and `\IgnoreMinipageWidths` may be used to tell lwarp to ignore the specified widths.

⚠ multicol Inside a `multicols`, `\linewidth` is divided by the specified number of columns.

⚠ text alignment Nested `minipages` adopt their parent's text alignment in HTML, whereas in regular LaTeX PDF output they do not. Use a `flushleft` or similar environment in the child `minipage` to force a text alignment.

for HTML output:
```
\begin{warpHTML}

94.2 Virtual page size

Ctr `LWR@virtualpagedepth` Used to only reset the line width at the outermost minipage.

```
\newcounter{LWR@virtualpagedepth}
\setcounter{LWR@virtualpagedepth}{0}
```

Env `LWR@setvirtualpage` `*` `[`⟨*columns*⟩`]`

If not nesting a minipage, adjust `\linewidth`, `\textwidth`, and `\textheight` for a virtual 6×9 page, and start on a new PDF page to help prevent page overflows.

If starred, force a new page in the PDF before generating more HTML. This may be done to reduce the chance of page overflow when starting a new minipage.

The optional number of columns defaults to 1.

```
\NewDocumentEnvironment{LWR@setvirtualpage}{s O{1}}{%
    \ifnumequal{\value{LWR@virtualpagedepth}}{0}{%

Set the user-accessible line and text width and height values inside the virtual minipage. These do not affect the actual size of the PDF output, but are used by any reference to `\linewidth`, etc. inside the virtual minipage being created here. `\LWR@minipagewidth` was the original then padded by 3em, which is restored here. This is done instead of settings back to #4, in case #4 was `\linewidth`, which was changed to 6in above.

`\fbox` {⟨*text*⟩}

Creates a framed inline span enclosing the text.

Create a new HTML version, but don't use it until after xcolor may have loaded:

```
\newcommand{\LWR@HTML@fbox}[1]{%

}
```

xcolor `\let`s things to `\fbox` when it is loaded, and this must remain even for HTML output while in a `lateximage`, so `\fbox` is not modified until `\AtBeginDocument`:

```
\AtBeginDocument{\LWR@formatted{fbox}}

`\fboxBlock` {⟨*text*⟩} Creates a framed HTML `<div>` of the text.

95 Direct formatting

⚠ \bfseries, etc. `\textbf`, etc. are supported, but `\bfseries`, etc. work only in some situations.

⚠ HTML special chars &, <, and > have special meanings in HTML. If `\&`, `\textless`, and `\textgreater` are used, proper HTML entities will be used, but there may be HTML parsing problems if these special characters occur unescaped in program listings or other verbatim text.

program listings For program listings, the listings package is supported, and its `literate` option is used to convert &, <, and > to proper HTML entities.

verbatim The various `verbatim`-related environments do not convert &, <, and >, so care must be taken to avoid accidentally including valid HTML code inside these environments. Adding a space on either side may be sufficient.

For high-level block and inline custom CSS classes, see section 52.10.

\LWR@minipagestartpars

Minipages are often placed side-by-side inside figures, with a bit of horizontal space to separate them. Since HTML does not allow a to be inside a p, paragraphs must be turned off during the generation of the minipage, then turned on after the minipage is complete. When this occurs between side-by-side minipages, lwarp correctly suppresses the paragraph tags between the minipages, unless some other text is between the minipages. Such text forms its own paragraph, resulting in text after a minipage to be on its own line. Since people often place small horizontal space between minipages, it is desirable to maintain this space if possible. lwarp tries to do this by remembering that a minipage has been seen, in which case paragraph tags are suppressed around \hspace, \enskip, \quad, and \qquad until the end of the paragraph, when the closing p tag is created.

\hspace
\enskip
\quad
\qquad

When a minipage is seen, the boolean LWR@minipagethispar is set, telling the following horizontal whitespace commands to try to suppress their surrounding paragraph tags. LWR@minipagethispar is cleared at the next end of paragraph, when the HTML paragraph closing tag is generated.

Placed just before \hspace, \quad, or \qquad's HTML output.

```
\newcommand*{\LWR@minipagestartpars}{%
    \ifbool{LWR@minipagethispar}{\LWR@startpars}{}%
}
```

\LWR@minipagestoppars

The HTML background color is used to draw the filled rule according to the LaTeX foreground color set by `\textcolor`.

```
    \ifbool{FormatWP}{}{background:\LWR@currenttextcolor ; }%
```

The width and height are printed, converted to PT:

```
    width:\LWR@printlength{\LWR@tempwidth} ; %
    height:\LWR@printlength{\LWR@tempheight} ; %
```

The raise height is converted to a CSS transform. The `*2` raise multiplier is to approximately match HTML output's X height. Conversion to a LaTeX length allows a typical LaTeX expression to be used as an argument for the raise, whereas printing the raise argument directly to HTML output without conversion to a LaTeX length limits the allowable syntax. To do: A superior method would compute a ratio of LaTeX ex height, then print that to HTML with an ex unit.

```

109 babel and polyglossia warnings

lwarp prints a message instructing the user how to avoid the following error.

(These are not `\PackageWarnings` because there may not be a problem.)

lwarp uses cleveref, which has some limitations when using polyglossia, possibly resulting in the error

```
! Undefined control sequence. . . . \__hook begindocument
```

To test compatibility, add

```
\usepackage{cleveref}
```

near the end of the preamble (as the last package to be loaded), and try to compile the print version. It may be necessary to set

```
\setdefaultlanguage{english}
```

or some other language supported by cleveref, then select other languages using `\setotherlanguages`.

Once the print version works with cleveref and polyglossia, the HTML version should work as well using lwarp.

for HTML output:

```

abstract is supported and patched by lwarp.

⚠ missing TOC

If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

for HTML output:

memoir provides an abstract environment even though it is not an article or report class. Meanwhile, lwarp loads book to emulate memoir, but book does not have an abstract environment, so when the abstract package is loaded for emulation there is no pre-existing abstract to redefine, which would cause an error. Thus, a null abstract is provide here:

accents

(*Emulates or patches code by* Javier Bezos.)

Pkg accents

accents is used as-is for SVG math, and is emulated for MathJax.

```

For MathJax:

```
\begin{warpMathJax}
\LWR@infoprocessingmathjax{accents}

\CustomizeMathJax{\newcommand{\ring}[1]{\mathring{#1}}}
\CustomizeMathJax{\newcommand{\accentset}[2]{\overset{#1{}}{#2}}}
```

As of this writing, MathJax v3 does not yet support groups for macros, so for \underaccent, the originals are remembered here, then they are temporarily redefined and used inside \underaccent, then restored to their originals. \LARGE gives a reasonable size, and \raise is used to adjust vertically without introducing extra line space.

Uses `\textit` instead of `\itshape`:

```
\renewcommand{\acfia}[1]{%

Removes the mbox to allow math inside:

```
\renewcommand*\AC@acs[1]{%

```

Fix for acronym labels in the captions of floats.

}%
```

Improve paragraph handling:

```
\BeforeBeginEnvironment{acronym}{\LWR@stoppars}

§ 123 Package

adjmulticol

(*Emulates or patches code by* Boris Veytsman.)

Pkg adjmulticol

adjmulticol is emulated.

Emulation similar to multicols is used, with adjusted margins. If the number of columns is specified as 1, it is set so, but if two or greater are used, lwarp allows a variable number of columns up to three.

for HTML output:

```
\LWR@ProvidesPackageDrop{adjmulticol}[2012/01/20]
\RequirePackage{multicol}
```

adjmulticols * {⟨*numcols*⟩} {⟨*left margi*⟩} {⟨*right margin*⟩}

```
\NewDocumentEnvironment{adjmulticols}{s m m m}
{%
```

Compute the margins, and limit to positive only:

```
\setlength{\LWR@templengthone}{#3}%
\ifdimcomp{\LWR@templengthone}{<}{0pt}{\setlength{\LWR@templengthone}{0pt}}{}%
\setlength{\LWR@templengthtwo}{#4}
\ifdimcomp{\LWR@templengthtwo}{<}{0pt}{\setlength{\LWR@templengthtwo}{0pt}}{}%
```

If one column is specified, use a of class singlecolumn, else use multicols:

```
\newcommand*{\LWR@mcolstype}{multicols}%
\ifnumcomp{#2}{=}{1}{\renewcommand*{\LWR@mcolstype}{singlecolumn}}{}%
```

Help avoid page overflow:

```
\LWR@forcenewpage%
```

Create the with the given margin and class:

```
\BlockClass[%
    \LWR@print@mbox{margin-left:\LWR@printlength{\LWR@templengthone}} ; %
    \LWR@print@mbox{margin-right:\LWR@printlength{\LWR@templengthtwo}}%
]{\LWR@mcolstype}%
}
{\endBlockClass}

```

File 17 **lwarp-algorithm2e.sty**

§ 126 Package algorithm2e

(*Emulates or patches code by* Christophe Fiorio.)

Pkg algorithm2e

algorithm2e is patched for use by lwarp.

For print output, captions are placed according to package options, but for HTML output captions are placed where used. Therefore, to have captions appear at the top of the algorithms for both print and HTML, place each captions at the top of each algorithm.

for HTML output:

```
\LWR@ProvidesPackagePass{algorithm2e}[2017/07/18]
```

For the list-of entries:

```
\renewcommand{\l@algocf}[2]{\hypertocfloat{1}{algocf}{loa}{#1}{#2}}
```

Select the lwarp float style according to the algorithm2e style:

```
\newcommand*{\LWR@floatstyle@algocf}{ruled}

\ifdefstring{\algocf@style}{boxed}{%
\renewcommand*{\LWR@floatstyle@algocf}{boxed}
}{}

```

```
\ifdefstring{\algocf@style}{boxruled}{%
\renewcommand*{\LWR@floatstyle@algocf}{boxruled}
}{}

\ifdefstring{\algocf@style}{plain}{%
\renewcommand*{\LWR@floatstyle@algocf}{plain}
}{}
```

Paragraph handling to allow line numbers under certain conditions:

```
\renewcommand{\algocf@everypar}{%
    \ifbool{LWR@algocf@dopars}{%
        \ifbool{LWR@doingstartpars}{%
            \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
                {}%
                {%
```

algorthm2e uses `\everypar`, so the open paragraph tag is generated here instead of `\LWR@openparagraph`:

```
                  \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%

                    \algocf@everyparnl\algocf@everyparhanging%
                }%
        }{}%
    }{}%
}
```

lwarp caption handling:

```
\renewcommand{\algocf@makecaption}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}
```

Print any caption where it is declared:

```
\renewcommand{\algocf@makecaption@plain}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}

\renewcommand{\algocf@makecaption@boxed}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}

\renewcommand{\algocf@makecaption@ruled}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}
```

Turn off line numbering while making the caption:

```
\long\def\algocf@latexcaption#1[#2]#3{% original definition of caption
\boolfalse{LWR@algocf@dopars}%      lwarp
  \par%
  \addcontentsline{\csname ext@#1\endcsname}{#1}%
 {\protect\numberline{\csname the#1\endcsname}{\ignorespaces \LWR@isolate{#2}}}%
  \begingroup%
  \@parboxrestore%
  \if@minipage%
    \@setminipage%
  \fi%
  \normalsize%
  \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par%
  \endgroup%
\booltrue{LWR@algocf@dopars}%       lwarp
}
```

Line numbers are printed in a of class `alg2elinenumber`:

```
\renewcommand{\algocf@printnl}[1]{%
    \InlineClass{alg2elinenumber}{\NlSty{#1}}~%
}%
```

While initializing an algorithm environment, locally declare the style of a regular figure to be the same as the algorithm style, in case the `figure` option was used.

```
\preto\@algocf@init{%
  \edef\LWR@floatstyle@figure{\LWR@floatstyle@algocf}%
}
```

For lwarp, the algorithm is not assembled inside a box, since `latexi`mages would not work, so the captions are printed where declared.

```
\renewcommand{\@algocf@start}{%
   \let\@mathsemicolon=\;\def\;{\ifmmode\@mathsemicolon\else\@endalgoln\fi}%
%      \raggedright%
    \AlFnt{}%
    \booltrue{LWR@algocf@dopars}% lwarp
}

\renewcommand{\@algocf@finish}{%
    \boolfalse{LWR@algocf@dopars}% lwarp
    \lineskip\normallineskip\setlength{\skiptotal}{\@defaultskiptotal}%
    \let\;=\@mathsemicolon%
    \let\]=\@emathdisplay%
}
```

Use an HTML break:

```
\renewcommand{\BlankLine}{%
\LWR@stoppars%
\LWR@htmltagc{br /}%
\LWR@startpars%
}
```

Simplified for HTML. The paragraph handling must be preserved.

```
\renewcommand{\SetKwInOut}[2]{%
  \algocf@newcommand{#1}[1]{%
    \ifthenelse{\boolean{algocf@hanginginout}}%
```

```

    \ifthenelse{\boolean{algocf@hanginginout}}%
        {\relax}%
        {\algocf@reseteveryparhanging}%
  }%
}%

\renewcommand{\ResetInOut}[1]{}%
```

Each of the following creates a of a given class, and turns off line numbering while creating the tags:

§ 135 Package

ar

(*Emulates or patches code by* Agostino De Marco.)

ar is patched for use by lwarp.

for HTML output:

```

```

Measure and print the width of the supplied glyph.

```
\newlength{\LWR@ar@width}

\newcommand*{\LWR@ar@printwidth}[1]{%
    \setlength{\LWR@ar@width}{\widthof{#1}}%
    width:%
    \LWR@convertto{em}{\the\LWR@ar@width}em%
}
```

The HTML version of \AR:

```
\newrobustcmd*{\LWR@HTML@AR}{%
```

Start a hashed `lateximage`, additionally hashed by the font series, with a width depending on the given glyph:

```
  \begin{lateximage}*[AR][\LWR@f@series][\LWR@ar@printwidth{\LWR@print@AR}]%
```

For text mode, set the font series according to the HTML font series:

```
    \ifmmode\else\csuse{LWR@orig\LWR@f@series series}\fi%
```

Print the original glyph using the newly set font series:

```
    \LWR@print@AR%
```

Done.

```
    \end{lateximage}%
}
```

Combine the print and HTML versions:

```
\LWR@formatted{AR}

\newrobustcmd*{\LWR@HTML@ARb}{%
    \begin{lateximage}*[AR][b][\LWR@ar@printwidth{\LWR@print@ARb}]%
    \LWR@print@ARb%

File 28 **lwarp-array.sty**

§ 137 Package
# array

Pkg array

array is used as-is for print output, and emulated for HTML.

plarray and plextarray do not affect `\firsthline` or `\lasthline`, and so are not affected by the following.

for HTML output:

If array is not yet loaded, remove the default nullfied macros:

```
\IfPackageLoadedTF{array}{}{%
    \let\firsthline\relax
    \let\lasthline\relax
}

\LWR@ProvidesPackagePass{array}[2018/12/30]
```

Provide simplified column types for HTML:

```
\HTMLnewcolumntype{w}[2]{#1}
\HTMLnewcolumntype{W}[2]{#1}
```

More HTML versions:

```
\newcommand*{\LWR@HTML@firsthline}{\LWR@HTMLhline}%
\LWR@expandableformatted{firsthline}

\newcommand*{\LWR@HTML@lasthline}{\LWR@HTMLhline}%
\LWR@expandableformatted{lasthline}

\let\tabularnewline\\
\providecommand*{\LWR@HTML@tabularnewline}{\LWR@tabularendofline}
\LWR@formatted{tabularnewline}
```

For MathJax:

```
\CustomizeMathJax{
    \newcommand{\multicolumn}[3]{#3}% only uses one cell
}
```

File 29 **lwarp-arydshln.sty**

§ 138 Package

arydshln

(*Emulates or patches code by* Hiroshi Nakashima.)

Pkg arydshln

arydshln heavily patches tabular code, so the actual package is not used. arydshln is emulated for HTML `tabular`, and reverts to solid rules for SVG math `array` and `tabular` in a `lateximage`.

CSS is not able to display a double-dashed border, so a single-dashed rule is displayed as a single-dashed border, and a double-dashed rule is displayed as a thicker single-dashed border.

For MathJax, limited emulation is provided for math mode.

for HTML output: array is required to allow `\newcolumn` below.

```
\RequirePackage{array}
```

```
\LWR@ProvidesPackageDrop{arydshln}[2018/09/26]
```

Ignored, but included for source compatibility:

```
\newdimen\dashlinedash \dashlinedash4pt %

\def\ADLsomewide{}
\def\ADLnullwidehline{}
\def\ADLsomewidehline{}

\def\ADLactivate{}
\def\ADLinactivate{}
\newcommand*{\ADLdrawingmode}[1]{}
\newcommand*{\ADLnoshorthanded}{}
\newcommand*{\dashgapcolor}[2][]{}
\newcommand*{\nodashgapcolor}{}
```

In a `lateximage`, revert to solid vertical rules:

```
\appto\LWR@restoreorigformatting{%
\newcolumntype{:}{|}%
\newcolumntype{;}[1]{|}%
\LetLtxMacro\hdashline\hline%
}
```

Some of these macros are already defined as temporary placeholders in the lwarp core, so they must be redefined here.

The emulated defaults also work for an emulated print mode inside a `lateximage`:

```
\def\hdashline{
```

```
%     \adl@hdashline\adl@ihdashline
    \adl@hdashline\adl@inactivehdl
}

File 34 **lwarp-authblk.sty**

§ 143 Package

authblk

(*Emulates or patches code by* Patrick W. Daly.)

Pkg authblk

authblk is patched for HTML.

package support
⚠ load order

lwarp supports the native LaTeX titling commands, and also supports the packages authblk and titling. If both are used, authblk should be loaded before titling.

\published and \subtitle

If using the titling package, additional titlepage fields for \published and \subtitle may be added by using \AddSubtitlePublished in the preamble. See section 69.8.

(*Emulates or patches code by* Patrick W. Daly.)

for HTML output:

Require that authblk be loaded before titling:

```
\IfPackageLoadedTF{titling}{
    \PackageError{lwarp-authblk}
        {Package authblk must be loaded before titling}
        {%
            Titling appends authblk's author macro,
            so authblk must be loaded first.%
        }
}
{\relax}
```

Load authblk:

```
\LWR@ProvidesPackagePass{authblk}[2001/02/27]
```

Patch to add a class for the affiliation:

```
\LetLtxMacro\LWRAB@affil\affil

\renewcommand{\affil}[2][]{%
\LWRAB@affil[#1]{\protect\InlineClass{affiliation}{#2}}
}
```

Create an HTML break for an \authorcr:

```
\renewcommand*{\authorcr}{\protect\LWR@newlinebr}
```

File 35 **lwarp-autobreak.sty**

§ 144 Package autobreak

(*Emulates or patches code by* Takahiro Ueda.)

Pkg autobreak

autobreak is used as-is for SVG math, and nullified for MathJax.

for HTML output:

```
\LWR@ProvidesPackagePass{autobreak}[2017/02/23]
```

For MathJax. The modified `align` environment is used for SVG math, but is reverted to its original for MathJax. (Extraneous commas were appearing in the result.)

```
\begin{warpMathJax}
\renewenvironment{autobreak}{\newcommand{\MoveEqLeft}[1]{}}{}
\let\start@align\@autobreak@oldstart@align

§ 154 Package

biblatex

(*Emulates or patches code by* Philipp Lehman.)

Pkg biblatex

When biblatex is used, modifications from newfloat may have to be undone.

for HTML output:

1. lwarp uses newfloat.
2. For classes with chapters which newfloat does not know about, such as CTEX-related classes, newfloat may modify `\addtocontents`.
3. biblatex, though, wants to patch `\addtocontents`, which causes an error if `\addtocontents` has been changed.
4. Therefore, `\addtocontents` is restored to its original here, since biblatex is about to be loaded.
5. This means that the newfloat's `chapterlistsgaps` option may no longer work.

```
\ifdef{\newfloat@addtocontents@ORI}{
```

```
    \let\addtocontents\newfloat@addtocontents@ORI
}{}
```

hyperref emulation is loaded \AtBeginDocument to avoid an options clash.

§ 156 Package bigdelim

(*Emulates or patches code by* Piet van Oostrum, Øystein Bache, Jerry Leichter.)

Pkg bigdelim

bigdelim is used as-is for print or lateximage, and patched for HTML.

The delimiters are displayed in HTML by printing the delimiter, the text, and a thick border across the side of the \multirow which indicates the actual height of the delimiter. The delimiter character is given a class of ldelim or rdelim, and the default CSS sets this to font-size:200%

⚠ use \mrowcell

\ldelim and \rdelim use \multirow, so \mrowcell must be used in the proper

number of empty cells in the same column below \ldelim or \rdelim, but not in cells which are above or below the delimiter:

```
\begin{tabular}{lll}
<empty> & a & b \\
\ldelim{\{}{3}{.25in}[left ] & c & d \\
\mrowcell & e & f \\
\mrowcell & g & h \\
<empty> & i & j \\
\end{tabular}
```

<-> a b

left { c d
e f
g h

<-> i j

For MathJax, limited emulation is provided which merely prints the delimter and optional text in the first row.

for HTML output: First, remove the temporary definitions of \ldelim and \rdelim, which were previously defined for tabular scanning in case bigdelim was not loaded:

```
\let\ldelim\relax
\let\rdelim\relax
```

Next, load the package's new definitions:

```
\LWR@ProvidesPackagePass{bigdelim}[2021/03/15]
```

\ldelim {⟨*1:delimiter*⟩} {⟨*2:#rows*⟩} [⟨*3: vmove*⟩] {⟨*4:width*⟩} [⟨*5:text*⟩]
\rdelim

```

\renewcommand{\LWR@multirowborder}{left}%
\multirow{#2}{#4}{\InlineClass{rdelim}{#1} #5}%
}

```

Limited emulation for MathJax. The delimiter is printed on the first row, along with any optional text.

File 55 **lwarp-booktabs.sty**

§ 164 Package

booktabs

(*Emulates or patches code by* Simon Fear.)

Pkg booktabs

booktabs is emulated during HTML output, and used as-is during print output and inside an HTML lateximage.

⚠ \cmidrule

For MathJax, emulation is provided in math mode, but \cmidrule trim must not be used.

for HTML output:

If booktabs has already been loaded before lwarp, such as by memoir, use it as-is. If not, the lwarp core will have placed some dummy macros which should be removed before loading the actual booktabs definitions.

```
\IfPackageLoadedTF{booktabs}{}{

If using `\polymerdelim` to add delimiters to a `\chemfig`, wrap both inside a single `lateximage`:

```

File 82 **lwarp-chemformula.sty**

§ 191 Package

chemformula

(*Emulates or patches code by* Clemens Niederberger.)

Pkg chemformula

chemformula is patched for use by lwarp.

The svg images are hashed according to contents and local options. Global options are assumed to be constant document-wide.

⚠ chemformula with MathJax

chemformula works best without MathJax. If MathJax is used, `\displaymathother` must be used before `array`, and then `\displaymathnormal` may be used after. (The chemformula package adapts to `array`, but does not know about MathJax, and MathJax does not know about chemformula.)

While using MathJax, `\displaymathother` may also be used for other forms of display and inline math which contain chemformula expressions.

for HTML output:

```
\LWR@ProvidesPackagePass{chemformula}[2022/01/23]

\ExplSyntaxOn
```

`\ch`

Enclose in an inline svg image or MathJax. The `alt` tag is is the contents of the `\ch` expression. The filename is hashed, and also has additional hashing information based on the local options.

```
\RenewDocumentCommand \ch { O{}m }
 {%
```

To work inside `align` with `\displaymathother`, a simple version must be used to work with chemformula's adaptation to `align`.

```
    \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%  lwarp
    {
        \chemformula_ch:nn {#1} {#2}%   original
    }
```

If used as the outer level, must temporarily ensure MathJax is disabled:

```
    {
        \begingroup%
        \boolfalse{mathjax}%
```

An inline image is used, adjusted for the baseline:

```
        \LWR@subsingledollar*{% lwarp
```

```
            \textbackslash{}%
            ch%

lwarp redefines the $ character, so special handling is required to escape math expressions inside \ch.

This boolean tracks a new kind of escaped math:

```
\bool_new:N      \l__chemformula_first_last_LWRdollar_bool
```

\chemformula_input_escape_math

Adds additional escaping for the new dollar definition:

```
\cs_gset_protected:Npn \__chemformula_input_escape_math:n #1
  {
    \__chemformula_first_last_math:n {#1}
    \bool_if:NT \l__chemformula_first_last_dollar_bool
      {
        \bool_set_true:N \l__chemformula_first_last_math_bool
        \__chemformula_read_escape_dollar:w #1 \q_nil
      }
    \bool_if:NT \l__chemformula_first_last_mathbraces_bool
      {
        \bool_set_true:N \l__chemformula_first_last_math_bool
        \__chemformula_read_escape_mathbraces:w #1 \q_nil
      }
```

Added by lwarp:

```
    \bool_if:NT \l__chemformula_first_last_LWRdollar_bool%      lwarp
      {
        \bool_set_true:N \l__chemformula_first_last_math_bool%  lwarp
        \__chemformula_read_escape_LWRdollar:w #1 \q_nil%       lwarp
      }
  }
```

\chemformula_read_escape_LWRdollar

The following parses the contents inside the new dollars.

lwarp keeps the dollar as its original math shift until the document starts. While chemmacros is being patched, the dollar must temporarily be set to its new meaning during the following definition.

```
\begingroup
\catcode`\$=\active

\cs_new_protected:Npn \__chemformula_read_escape_LWRdollar:w $#1$ \q_nil
{
    \__chemformula_read_escape_math:n {#1}
}

```

```
\endgroup
```

\chemformula_bool_set_if_first_last

The following looks at the first and last tokens for delimiters to escape math inside \ch. The original definition is modified to look for the control sequences which are used by the new meaning of $.

```
\cs_new_protected:Npn \__chemformula_bool_cs_set_if_first_last:NnNN #1#2#3#4
  {
    \int_zero:N \l__chemformula_tmpa_int
    \int_zero:N \l__chemformula_tmpb_int
    \int_set:Nn \l__chemformula_tmpa_int { \tl_count:n {#2} }
    \tl_map_inline:nn {#2}
      {
        \int_incr:N \l__chemformula_tmpb_int
        \int_compare:nT { \l__chemformula_tmpb_int = 1 }
          {
```

At the start, the cs_ version compares control sequences:

```
            \ifdefstrequal{##1}{#3}% lwarp
                {
                    \bool_set_true:N #1
                }% lwarp
                {}
          }
```

At the end, compare more control sequences:

```
      \int_compare:nT { \l__chemformula_tmpb_int = \l__chemformula_tmpa_int }
          {
            \ifdefstrequal{##1}{#4}
                {}
                {
                    \bool_set_false:N #1
                }
          }
      }
  }
```

\chemformula_first_last_math

Modified to check for the new meaning of $ at first/last:

```
\cs_gset_protected:Npn \__chemformula_first_last_math:n #1
  {
    \bool_set_false:N \l__chemformula_first_last_math_bool
    \bool_set_false:N \l__chemformula_first_last_dollar_bool
    \bool_set_false:N \l__chemformula_first_last_LWRdollar_bool%    lwarp
    \bool_set_false:N \l__chemformula_first_last_mathbraces_bool
    \__chemformula_bool_set_if_first_last:Nnnn
      \l__chemformula_first_last_dollar_bool
      {#1}
      { $ } { $ }
    \bool_if:NF \l__chemformula_first_last_dollar_bool
      {
        \__chemformula_bool_set_if_first_last:Nnnn
          \l__chemformula_first_last_mathbraces_bool
          {#1}
```

```
199          { \( } { \) }
```

Added by lwarp:

Pkg chemgreek

chemgreek is patched for use by lwarp.

Greek symbols

⚠ package selection

To use text-mode symbols, use packages textalpha or textgreek. Using the other packages supported by chemgreek will result in math-mode greek characters, which will result in SVG images being used. These images will be hashed.

⚠ XeLaTeX, LuaLaTeX

If using XeLaTeX or LuaLaTeX, select the `fontspec` mapping:

```
\selectchemgreekmapping{fontspec}
```

for HTML output:

```
1 \LWR@ProvidesPackagePass{chemgreek}[2020/01/16]

2 \ExplSyntaxOn

4 \cs_gset_protected:Npn \chemgreek_text:n #1

File 84 **lwarp-chemmacros.sty**

§ 193 Package chemmacros

(*Emulates or patches code by* Clemens Niederberger.)

Pkg chemmacros

chemmacros is patched for use by lwarp.

for HTML output:

```
1 \LWR@ProvidesPackagePass{chemmacros}[2022/02/13]
```

SVG file hashing assumes that the relevent options are constant for the entire document.

§ 193.1 Changes to the user's document

⚠ \makepolymerdelims When using \makepolymerdelims, enclose the entire expression inside a polymerdelims environment, such as (from the chemmacros manual):

```
\begin{polymerdelims}
\chemfig{-[@{op,.75}]CH_2-CH(-[6]Cl)-[@{cl,0.25}]}
\makepolymerdelims{5pt}[27pt]{op}{cl}
\end{polymerdelims}
```

⚠ redox reactions Redox reactions must be enclosed inside a redoxreaction environment. For print output, extra space must be included above and/or below the result, so they are declared as arguments to the environment, instead of being manually entered as per the chemmacros manual. For HTML output, the extra space is ignored and a lateximage is used instead.

```
\begin{redoxreaction}{7mm}{7mm}
\OX{a,Na} $\rightarrow$ \OX{b,Na}\pch\redox(a,b){oxidation}
\end{redoxreaction}
```

§ 193.2 Code

```
\ExplSyntaxOn
```

§ 193.3 Loading packages

Also accept the lwarp version:

```
\prg_set_conditional:Npnn \chemmacros_if_package_loaded:n #1 {p,T,F,TF}
 {
   \cs_if_exist:cTF {ver@#1.sty}
     { \prg_return_true: }
     {
       \cs_if_exist:cTF {ver@lwarp-#1.sty}
           { \prg_return_true: }
           { \prg_return_false: }
     }
 }
```

Nullify hyperref detection:

```
\hook_gput_code:nnn {begindocument/end} {chemmacros}
 {
     \bool_set_false:N \l__chemmacros_hyperref_bool
 }
```

§ 193.4 Loading modules

Patching chemmacros modules must be done `\AtBeginDocument`, since modules are invoked by the user in the preamble, and each patch is only done if the module is loaded.

§ 193.5 New environments

`\makepolymerdelims` and redox reactions must be enclosed in a `lateximage` during HTML output. These environments are provided here in HTML mode, and in the lwarp core in print mode, as a high-level semantic syntax which automatically embeds the contents in a `lateximage` with an appropriate `alt` tag.

Env `polymerdelims`

```
\DeclareDocumentEnvironment{polymerdelims}{}
{\begin{lateximage}[-chemmacros- polymer]}
{\end{lateximage}}
```

Env `redoxreaction` {⟨*space above*⟩} {⟨*space below*⟩}

For HTML output, the above and below space is ignored, and a `lateximage` is used instead. For the print output version, see section 90.

```
\DeclareDocumentEnvironment{redoxreaction}{m m}
{\begin{lateximage}[-chemmacros- redoxreaction]}
{\end{lateximage}}
```

§ 202 Package

cleveref

(*Emulates or patches code by* Toby Cubitt.)

Pkg cleveref

cleveref is patched for HTML, and limited MathJax emulation is added.

⚠ cleveref page numbers

cleveref and varioref are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for \cpageref and \cpagerefrange. This phrase includes \cpagerefFor, which defaults to "for".

Ex:

```
    \cpageref{tab:first,tab:second}
 in html becomes:
    "pages for table 4.1 and for table 4.2"
```

See \cpagerefFor at page 730 to redefine the message which is printed for page number references.

Table 16 on page 491 shows the data structure of the label/reference system as revised by lwarp and cleveref.

For MathJax, each references is printed as an \eqref, without cleveref's description text. Page references are also printed as simple \eqrefs. Multiple labels in a single \cref will print as (???) in MathJax.

⚠ multiple labels

for HTML output:

```
1 \LWR@ProvidesPackagePass{cleveref}[2018/03/27]
```

The following patches are applied. Print-mode versions are not required since they all come down to \ref eventually, and \ref has a print-mode version.

\@@@setcref {⟨*kindofref*⟩} {⟨*label*⟩}

\@templabel becomes the section number.

⚠ limitations

The MathJax emulation ignores all package options, except `slantedGreek` is honored, and `\mathbold` is available.

The dedicated macros for upright Greek letters do work correctly.

svg math should appear the same as the printed output.

Since Unicode symbols are not available for each of the following, only two are used for the single and double colons, and the other symbols are derived in a consistent manner. Occasional negative space is added as well. This may need to be undone for some fonts.

File 132 **lwarp-enumerate.sty**

§ 241 Package enumerate

Pkg enumerate

enumerate is supported with no changes.

This package is only required because it was used in the past to drop and then emulate the package. It cannot be removed because an older version which dropped the package may still remain, for example in a local vs. distribution directory, but it is now supported directly by lwarp and thus must no longer be dropped.

for HTML output:

```
\LWR@ProvidesPackagePass{enumerate}[2015/07/23]

§ 242 Package enumitem

(*Emulates or patches code by* Javier Bezos.)

Pkg enumitem

enumitem is supported with minor adjustments.

for HTML output:

```

\newlist {⟨*name*⟩} {⟨*type*⟩} {⟨*maxdepth*⟩}
\renewlist {⟨*name*⟩} {⟨*type*⟩} {⟨*maxdepth*⟩}

For enumitem lists, new lists must have the start and end actions assigned to the new environment. Renewed lists already have their actions assigned, and thus need no changes.

File 136 **lwarp-epsfig.sty**

§ 245 Package

epsfig

Pkg epsfig

epsfig is emulated for use by lwarp.

Only the LaTeX2e syntax is emulated.

for HTML output:

```
\LWR@ProvidesPackagePass{epsfig}[2017/06/25]
```

A few additional keys to capture the filename:

```
\RequirePackage{graphics}

\define@key{igraph}{file}{%
    \xdef\LWR@epsfig@filename{#1}%
}

\define@key{igraph}{figure}{%
    \xdef\LWR@epsfig@filename{#1}%
}

```

```
\define@key{igraph}{prolog}{}

\define@key{igraph}{silent}[]{}
```

The captured filename is used as the argument to `\includegraphics`:

```
\newcommand{\LWR@HTML@epsfig}[1]{\includegraphics[#1]{\LWR@epsfig@filename}}
\LWR@formatted{epsfig}

\newcommand{\LWR@HTML@psfig}[1]{\includegraphics[#1]{\LWR@epsfig@filename}}
\LWR@formatted{psfig}

§ 246 Package epstopdf

Pkg epstopdf

Previous versions of lwarp had a nullfied version, but now epstopdf-base is supported. lwarp-epstopdf becomes a placeholder to overwrite previous versions.

See package epstopdf-base for details.

for HTML output:

```
\LWR@ProvidesPackagePass{epstopdf}[2020-01-24]
```

File 138 **lwarp-epstopdf-base.sty**

§ 247 Package epstopdf-base

Pkg epstopdf-base

⚠ convert to .svg

Images with an .eps extension will be converted to .pdf. The HTML output uses the .svg version, so use

Enter ⇒ **lwarpmk pdftosvg <listofPDFfiles>**

to generate .svg versions.

for HTML output:

```
\LWR@ProvidesPackagePass{epstopdf-base}[2020-01-24]
```

Redefine to remember the image filename, replacing .pdf with .svg. Use the epstopdf print version inside a lateximage.

```
\newcommand*{\LWR@HTML@ETE@OrgGin@setfile}[3]{%
    \edef\LWR@tempone{#3}%
    \StrSubstitute{\LWR@tempone}{.pdf}{.svg}[\LWR@tempone]%
    \StrSubstitute{\LWR@tempone}{.PDF}{.SVG}[\LWR@tempone]%
    \xdef\LWR@parsedfilename{\LWR@tempone}%
}

\LWR@formatted{ETE@OrgGin@setfile}
```

`\includegraphics` in HTML mode redefines `\Gin@setfile` to be `\LWR@HTML@Gin@setfile`, which is now redirected to epstopdf's version:

```
\renewcommand*{\LWR@HTML@Gin@setfile}[3]{%
    \ETE@Gin@setfile{#1}{#2}{#3}%
}
```

Allow .eps images to be found if a suffix is not provided:

```

}
\DeclareGraphicsRule{.svg}{svg}{.svg}{}
\DeclareGraphicsRule{.SVG}{svg}{.SVG}{}
}
```

Likewise when inside a `lateximage`:

```
\appto\LWR@restoreorigformatting{%
\DeclareGraphicsExtensions{%
    .eps,.EPS,.pdf,.PDF,.gif,.GIF,.png,.PNG,.jpg,.JPG,.jpeg,.JPEG%
}%
}

⚠ \tableofcontents with \ref

The etoc package uses a non-standard syntax which looks ahead after a \tableofcontents for a following \ref. These \refs appear in the HTML result unless they are removed. Where a \tableofcontents is followed by \ref, and perhaps also \label as well, enclose all of them inside \warpprintonly:

```
\warpprintonly{\tableofcontents \ref{toc:abc}
\label{toc:def}}
```

or place all code related to a local `\tableofcontents` inside a `warpprint` environment.

⚠ home page Be sure to keep the initial `\tableofcontents` on the home page, perhaps in its own `\warpHTMLonly` macro or `warpHTML` environment.

File 150 **lwarp-fancybox.sty**

§ 259 Package

fancybox

(*Emulates or patches code by* Timothy Van Zandt.)

Pkg fancybox

fancybox is supported with some patches.

framed equation example

fancybox's documentation has an example FramedEqn environment which combines math, \Sbox, a minipage, and an \fbox. This combination requires that the entire environment be enclosed inside a lateximage, which is done by adding \lateximage at the very start of FramedEqn's beginning code, and \endlateximage at the very end of the ending code. Unfortunately, the HTML alt attribute is not used here.

```
\newenvironmentFramedEqn
{
\lateximage% NEW
\setlength{\fboxsep}{15pt}
. . . }{. . .
\[\fbox{\TheSbox}\]
\endlateximage% NEW
}
```

framing alternatives

\fbox works with fancybox. Also see lwarp's \fboxBlock macro and fminipage environment for alternatives to \fbox for framing environments.

framed table example

The fancybox documentation's example of a framed table using an \fbox containing a tabular does not work with lwarp, but the FramedTable environment does work if \fbox is replaced by \fboxBlock. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a fminipage environment. The caption may be placed either inside or outside the fminipage:

```
\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
. . .
\end{tabular}
\end{fminipage}
\end{table}
```

⚠ framed verbatim

lwarp does not support the verbatim environment inside a span, box, or fancybox's \Sbox, but a verbatim may be placed inside a fminipage. The fancybox documentation's example FramedVerb may be defined as:

```
\newenvironment{FramedVerb}[1] % width
{
  \VerbatimEnvironment
  \fminipage{#1}
  \beginVerbatim
}{
  \endVerbatim
  \endfminipage
}
```

framed \VerbBox

fancybox's \VerbBox may be used inside \fbox.

indented alignment

LVerbatim, \LVerbatimInput, and \LUseVerbatim indent with horizontal space which may not line up exactly with what *pdftotext* detects. Some lines may be off slightly in their left edge.

fancybox, fancyvrb
⚠ \VerbatimFootnotes
⚠ sectioning or displaymath

If using fancybox or fancyvrb with \VerbatimFootnotes, and using footnotes in a sectioning command or display math, use \footnotemark and \footnotetext:

```
\subsection[Subsection Name]
    {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when \VerbatimFootnotes are selected. The browser usually compensates.

```
\LWR@ProvidesPackagePass{fancybox}[2010/05/15]
```

After the preamble is loaded, after any patches to Verbatim:

```
\AfterEndPreamble{
\LWR@traceinfo{Patching fancybox.}
```

\VerbatimFootnotes

Patched to use the new version.

```
\def\VerbatimFootnotes{%
\let\@footnotetext\V@footnotetext%
\let\LWR@footnotetext\V@footnotetext% lwarp
}
```

\V@@footnotetext

Patches in a subset of lwarp's \LWR@footnotetext to the fancyvrb version of \V@@footnotetext.

```
\def\V@@footnotetext{%
\LWR@traceinfo{V@footnotetext}%
```

Place an autopage marker so that back references to citations inside a footnote will link closer to the footnote text, if possible.

```
\LWR@newautopagelabel{page}%
```

Take the current footnote box, then append:

```
\global\setbox\LWR@footnotebox=\vbox\bgroup%
```

Add to any current footnotes:

```
    \unvbox\LWR@footnotebox%
```

Remember the footnote number for \ref:

```
    \protected@edef\@currentlabel{%
        \csname p@footnote\endcsname\@thefnmark%
    }% @currentlabel
```

Use HTML superscripts in the footnote even inside a lateximage:

```
    \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%
```

Use paragraph tags if in a tabular data cell or a lateximage:

```
    \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
```

Append the footnote to the list:

```
    \@makefntext{}%
```

The footnote text will follow after `\V@@@footnotetext` has completed.

```
  \bgroup%
  \aftergroup\V@@@footnotetext%
```

Do not generate autopages inside the footnotes, since they are accumulated at the moment before finally being used perhaps on a later page.

```
    \let\LWR@newautopagelabel\LWR@null@newautopagelabel%
  \ignorespaces%

```

`\V@@@footnotetext`

```

```

Convert minipages, parboxes, and lists into linear text using the `LWR@nestspan` environment:

```
\let\LWR@origSbox\Sbox

\def\Sbox{\LWR@origSbox\LWR@nestspan}

\let\LWR@origendSbox\endSbox

\def\endSbox{\endLWR@nestspan\LWR@origendSbox}
```

Beqnarray is adapted for MathJax or enclosed inside a lateximage:

```
\RenewEnviron{Beqnarray}
{\LWR@eqnarrayfactor}

\csgpreto{Beqnarray*}{\boolfalse{LWR@numbereqnarray}}
```

\GenericCaption is enclosed in an HTML block:

```
\renewcommand{\GenericCaption}[1]{%
    \LWR@figcaption%
    \LWR@isolate{#1}%
    \endLWR@figcaption%
}
```

Btrivlist is enclosed in an HTML block. This is a tabular, and does not use \item.

\trivlist {⟨*l/c/r*⟩} [⟨*t/c/b*⟩]

```
\RenewDocumentEnvironment{Btrivlist}{m o}

    \tabular{#1}%
}
{%
    \endtabular%
    \end{BlockClass}%
    \LWR@startpars%
}
```

Btrivlist is also neutralized when used inside a span:

```
\AtBeginEnvironment{LWR@nestspan}{%
    \RenewDocumentEnvironment{Btrivlist}{m o}{}{}%
}
```

lwarp's handling of \item is patched to accept fancybox's optional arguments:

```
\let\LWRFB@origitemizeitem\LWR@itemizeitem
\let\LWRFB@origdescitem\LWR@descitem

\RenewDocumentCommand{\LWR@itemizeitem}{d()o}{%
    \IfValueTF{#2}{%
        \LWRFB@origitemizeitem[#2]%
    }{%
        \LWRFB@origitemizeitem%
    }%
}

\RenewDocumentCommand{\LWR@descitem}{d()o}{%
    \IfValueTF{#2}{%
        \LWRFB@origdescitem[#2]~%
    }{%
        \LWRFB@origdescitem%
    }%
}
```

```
\RenewDocumentCommand{\LWR@nestspanitem}{d()}{%
    \if@newlist\else{
        \LWR@htmltagc{br /}%
        \LWR@orignewline%
    }\fi%
    \LWR@origitem%
}
```

The various boxed lists become regular lists:

```
\renewenvironment{Bitemize}[1][]
    {%
        \LWR@spanwarnformat{Bitemize}%
        \booltrue{LWR@starting@fancybox}%
        \begin{itemize}%
        \boolfalse{LWR@starting@fancybox}%
    }
    {\end{itemize}}

\renewenvironment{Benumerate}[1][]
    {%
        \LWR@spanwarnformat{Benumerate}%
        \booltrue{LWR@starting@fancybox}%
        \begin{enumerate}%
        \boolfalse{LWR@starting@fancybox}%
    }
    {\end{enumerate}}

\renewenvironment{Bdescription}[1][]
    {%
        \LWR@spanwarnformat{Bdescription}%
        \booltrue{LWR@starting@fancybox}%
        \begin{description}%
        \boolfalse{LWR@starting@fancybox}%
    }
    {\end{description}}
```

\boxput simply prints one then the other argument, side-by-side instead of above and behind:

```
\RenewDocumentCommand{\boxput}{s d() m m}{%
    \IfBooleanTF{#1}{#3\quad#4}{#4\quad#3}%
}
```

Neutralized commands:

```
\RenewDocumentCommand{\fancyput}{s d() m}{}
\RenewDocumentCommand{\thisfancyput}{s d() m}{}

\RenewDocumentCommand{\fancypage}{m m}{}
\RenewDocumentCommand{\thisfancypage}{m m}{}

\def\LandScape#1{}
\def\endLandScape{}
\def\@Landscape#1#2#3{}

§ 261 Package

fancypar

(*Emulates or patches code by* Gonzalo Medina.)

Pkg fancypar

fancypar is used as-is for print output, and emulated for HTML.

⚠ css classes

\NotebookPar and related are used as-is inside a lateximage, but for HTML these are emulated as a of class NotebookPar, etc. For HTML, the package options and the macro optional arguments are ignored. The user must provide custom CSS for each if visual effects are required. See section 7.7.

⚠ custom styles

If using a custom paragraph style, such as \MyStylePar from the documentation, use the following to generate an HTML of class MyStylePar:

```
... (existing definiton of \MyStylePar, print version) ...
\begin{warpHTML}
\AddFancyparClass{MyStyle}
\end{warpHTML}
```

\MyStylePar is then modified to emulate HTML. An optional argument is allowed, which is ignored.

§ 264 Package

fancyvrb

(*Emulates or patches code by* Timothy Van Zandt.)

Pkg fancyvrb

fancyvrb is supported with some patches.

HTML classes

The fancy verbatim environment is placed inside a of class fancyvrb. The label is placed inside a of class fancyvrblabel. The verbatim text itself is placed inside a of class verbatim.

fancybox, fancyvrb

⚠ \VerbatimFootnotes

⚠ sectioning or displaymath

If using fancybox or fancyvrb with \VerbatimFootnotes, and using footnotes in a sectioning command or display math, use \footnotemark and \footnotetext:

```
\subsection[Subsection Name]
    {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when \VerbatimFootnotes are selected. The browser usually compensates.

```
\AtBeginDocument{\RequirePackage{xcolor}}% for \convertcolorspec

\LWR@ProvidesPackagePass{fancyvrb}[2008/02/07]
```

Initial default patch for fancyvrb:

```

```

\VerbatimFootnotes

```
\def\VerbatimFootnotes{%

```

```
    \let\footnote\V@footnote%
    \let\LWR@footnotetext\V@footnotetext% lwarp

```

\V@@footnotetext

```
\def\V@@footnotetext{%

Place an autopage marker so that back references to citations inside a footnote will link closer to the footnote text, if possible.

```
    \LWR@newautopagelabel{page}%
```

Take the current footnote box, then append:

```
    \global\setbox\LWR@footnotebox=\vbox\bgroup%
```

Add to any current footnotes:

```
    \unvbox\LWR@footnotebox%
```

Remember the footnote number for \ref:

```
    \protected@edef\@currentlabel{%
        \csname p@footnote\endcsname\@thefnmark%
    }% @currentlabel
```

Use HTML superscripts in the footnote even inside a lateximage:

```
    \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%
```

Use paragraph tags if in a tabular data cell or a lateximage:

```
    \LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline%
```

Append the footnote mark to the list:

```
    \@makefntext{}%
```

The footnote text will follow after \V@@@footnotetext has completed.

```
    \bgroup%
    \aftergroup\V@@@footnotetext%
```

Do not generate autopages inside the footnotes, since they are accumulated at the moment before finally being used perhaps on a later page.

```
    \let\LWR@newautopagelabel\LWR@null@newautopagelabel%

    \ignorespaces%

```

\WR@fboxpkg@border {⟨*1: top/bottom/left/right*⟩} {⟨*2: t/b/l/r*⟩} {⟨*3: padding, or empty*⟩}

Accumulates HTML styles for border, and padding if given:

```
\newcommand*{\LWR@fboxpkg@border}[3]{%
    \colorlet{LWR@border@color}{\csuse{fbox@#2color}}%
  \protect\convertcolorspec{named}{LWR@border@color}{HTML}\LWR@tempbordercolor\relax%

A hack to reuse the same code for inline and blocks:

```
\newbool{LWR@fboxpkg@ispar}
\boolfalse{LWR@fboxpkg@ispar}
```

Acculumate HTML styles for left and right padding, depending on `\if@fbox@space@left`, `\if@fbox@space@right`:

        }
    \fi%
}
```

The HTML version, modified to use HTML styles and either an `\InlineClass` or `BlockClass`:

```

```

Find and set the text color, rule width, margin:

Generate a `BlockClass` or `\InlineClass` with the contents:

```

            \end{BlockClass}%
        }%
        {%
            \InlineClass[\LWR@tempone]{fboxpkg}{%
                #1%

        }%
    \color@endgroup
    \boolfalse{LWR@fboxpkg@ispar}% globally
}
\LWR@formatted{FBox@iii}
```

For `\fparbox`, set the use of `BlockClass`, then reuse the above:

```
\long\def\LWR@HTML@FParBox@i[#1]#2{%
    \booltrue{LWR@fboxpkg@ispar}%

⚠ external layouts

External layouts (`\fxloadlayouts`) are not supported.

Customized layouts are overwritten by lwarp's versions `\AtBeginDocument` in order to provide the HTML conversion. If creating a new layout, see lwarp's changes to provide similar for the new layout, inside a `warpHTML` environment.

User control is provided for setting the HTML styling of the "faces". The defaults are as follows, and may be changed in the preamble after fixme is loaded:

```
\def\FXFaceInlineHTMLStyle{font-weight:bold}
\def\FXFaceEnvHTMLStyle{font-weight:bold}
\def\FXFaceSignatureHTMLStyle{font-style:italic}
\def\FXFaceTargetHTMLStyle{font-style:italic}
```

for HTML output:

```
\LWR@ProvidesPackagePass{fixme}[2019/01/03]
```

Restore lwarp's version of `\@wrindex`, ignoring the fixme package's `target` option:

```
\let\@wrindex\LWR@wrindex
```

Float-related macros required by lwarp:

```
\newcommand{\ext@fixme}{lox}

\renewcommand{\l@fixme}[2]{%
    \hypertocfloat{1}{fixme}{lox}%
     {\LWR@nameref{\BaseJobname-autopage-\arabic{LWR@nextautopage}} --- #1}%
        {#2}
}
```

Other modifications. Done `\AtBeginDocument` to hopefully work if the user customizes the layouts.

```

\def\FXFaceInlineHTMLStyle{font-weight:bold}

\renewcommand*\FXLayoutInline[3]{ % space
    \InlineClass[\FXFaceInlineHTMLStyle]{fixmeinline}%

float

(*Emulates or patches code by* Anselm Lingnau.)

Pkg float

float is emulated.

Float styles boxed and ruled are emulated by CSS and a float class according to style.

The HTML <figure> class is set to the float type, so CSS may also be used to format the float and its caption, according to float type. Furthermore, an additional class is set to the float style: plain, plaintop, boxed, or ruled, so CSS may be used to format by float style as well. Default formatting by CSS is provided for ruled and boxed styles.

⚠ not seem to be a floating environment

Always declare a \newfloat before modifying it with \floatname, etc.

for HTML output:

```
\LWR@ProvidesPackageDrop{float}[2001/11/08]
```

\LWR@floatstyle The default float style.

```
\newcommand*{\LWR@floatstyle}{plain}
```

`\newfloat` {⟨*1: type*⟩} {⟨*2: placement*⟩} {⟨*3: ext*⟩} [⟨*4: within*⟩]

Emulates the `\newfloat` command from the float package.

"placement" is ignored.

```
\NewDocumentCommand{\newfloat}{m m m o}{%
    \IfValueTF{#4}%
        {\DeclareFloatingEnvironment[fileext=#3,within=#4]{#1}}%
        {\DeclareFloatingEnvironment[fileext=#3]{#1}}%
```

Remember the float style:

```
    \csedef{LWR@floatstyle@#1}{\LWR@floatstyle}%
```

newfloat package automatically creates the `\listof` command for new floats, but float does not, so remove `\listof` here in case it is manually created later.

```
    \cslet{listof#1s}\relax%
    \cslet{listof#1es}\relax%
```

Likesize, newfloat also creates `\l@<type>`, but float does not, so remove it here:

```
    \cslet{l@#1}\relax%
}
```

`\floatname` {⟨*type*⟩} {⟨*name*⟩}

Sets the text name of the float, such as "Figure". Avoids trying to set a recursive name, from trivfloat.

```
\NewDocumentCommand{\floatname}{m +m}{%
    \def\LWR@tempone{#2}%
    \def\LWR@temptwo{\@nameuse{#1name}}%
    \ifdefequal{\LWR@tempone}{\LWR@temptwo}{}{%
        \SetupFloatingEnvironment{#1}{name=#2}%
    }%
}
```

`\floatplacement` {⟨*type*⟩} {⟨*placement*⟩}

Float placement is ignored.

```
\newcommand*{\floatplacement}[2]{%
    \SetupFloatingEnvironment{#1}{placement=#2}%
}
```

`\floatstyle` {⟨*style*⟩}

Remember the style for future floats:

```
\newcommand{\floatstyle}[1]{%
    \def\LWR@floatstyle{#1}%
}%
```

`\restylefloat` * {⟨*type*⟩}

Remember the style for this float:

```

⚠ Misplaced alignment tab character &

Use \StartDefiningTabulars and \StopDefiningTabulars before and after defining macros using \ttabbox with a tabular inside. See section 8.10.1.

⚠ subfig package

When combined with the subfig package, while inside a subfloatrow \ffigbox and \ttabbox must have the caption in the first of the two of the mandatory arguments.

⚠ \FBwidth, \FBheight

The emulation of floatrow does not support \FBwidth or \FBheight. These values are pre-set to .3\linewidth and 2in. Possible solutions include:

- Use fixed lengths. lwarp will scale the HTML lengths appropriately.
- Use warpprint and warpHTML environments to select appropriate values for each case.
- Inside a warpHTML environment, manually change \FBwidth or \FBheight before the \ffigbox or \ttabbox. Use \FBwidth or \FBheight normally afterwards; it will be used as expected in print output, and will use your custom-selected value in HTML output. This custom value will be used repeatedly, until it is manually changed to a new value.

After everything has loaded, remember whether subcaption was loaded. If not, it is assumed that subfig is used instead:

```
\newbool{LWR@subcaptionloaded}

\AtBeginDocument{
\IfPackageLoadedTF{subcaption}
    {\booltrue{LWR@subcaptionloaded}}
    {\boolfalse{LWR@subcaptionloaded}}
}
```

\floatbox [⟨*1 preamble*⟩] {⟨*2 captype*⟩} [⟨*3 width*⟩] [⟨*4 height*⟩] [⟨*5 vert pos*⟩] {⟨*6 caption*⟩} {⟨*7 object*⟩}

Only parameters for captype, width, caption, and object are used.

LWR@insubfloatrow is true if inside a subfloatrow environment.

There are two actions, depending on the use of subcaption or subfig.

```
\NewDocumentCommand{\floatbox}{o m o o o +m +m}{%
\ifbool{LWR@subcaptionloaded}%
{% subcaption
```

```
    \ifbool{LWR@insubfloatrow}%

        {\@nameuse{sub#2}{\linewidth}}%
    }% subcaption in a subfloatrow
    {% subcaption not in subfloatrow
```

figure and table environments do not take a width argument.

```
        \@nameuse{#2}%
    }% subcaption not in subfloatrow
    #6

    #7
```

End the environments:

```
    \ifbool{LWR@insubfloatrow}%
    {\@nameuse{endsub#2}}%
    {\@nameuse{end#2}}%
}% subcaption
{% assume subfig
```

For subfig:

```
\ifbool{LWR@insubfloatrow}%
{% subfig in a subfloatrow
```

\subfloat is a macro, not an environment.

Package subfig's \subfloat command takes an optional argument which is the caption, but \floatbox argument #6 contains commands to create the caption and label, not the caption itself. Thus, \caption is temporarily disabled to return its own argument without braces.

```

fontawesome

(*Emulates or patches code by* Xavier Danaux.)

Pkg fontawesome

fontawesome is patched for use by lwarp.

Hashed inline images are used, as there may not be Unicode support for all icons.

⚠ *poppler* syntax warning

If using pdf LaTeX, *poppler* may issue a syntax warning regarding parsing a ligature component. XeLaTeX or LuaLaTeX may be used to avoid this warning.

In the following, the general strategy is to intercept `\symbol` and embed it inside a `lateximage`. These changes are done inside a local group.

For pdf LaTeX, the `alt` tag includes the icon (symbol) number. For XeLaTeX and LuaLaTeX, the `alt` tag is generic.

⚠ limitations

The MathJax emulation ignores all package options, except `sloped` and `upright` are honored for Greek characters, but MathJax cannot yet honor these for Latin characters.

The dedicated macros for upright and italic Greek letters do work correctly.

SVG math should appear the same as the printed output.

§ 314 Package gindex

(*Emulates or patches code by* Javier Bezos.)

Pkg gindex

gindex is patched for use by lwarp.

See section 8.6.15.

for HTML output:

```
\LWR@ProvidesPackagePass{gindex}[2019/10/07]
```

Set the index page and range separators. These are set `\AtBeginDocument` to allow the user to change them. They are then protected so that the lwarp core looks for the tokens instead of their expanded contents, since the `*.ind` files will contain `\indexpagessep` and `\indexrangesep` instead of their literal contents. Finally, lwarp is told of the gindex macros.

```
\AtBeginDocument{
    \robustify{\indexpagessep}
    \robustify{\indexrangesep}
    \renewcommand*{\IndexPageSeparator}{\indexpagessep}
    \renewcommand*{\IndexRangeSeparator}{\indexrangesep}

```

`\hyperindexref` is added:

```

\def\addindexsubitem#1#2{%

File 207 **lwarp-glossaries.sty**

§ 316 Package

glossaries

(*Emulates or patches code by* Nicola L.C. Talbot.)

Pkg glossaries

processing glossaries

Opt GlossaryCmd

Default: makeglossaries

Opt [lwarpmk] printglossary

Opt [lwarpmk] htmlglossary

lwarpmk has the commands **lwarpmk printglossary** and **lwarpmk htmlglossary**, which process the glossaries created by the glossaries package using that package's *makeglossaries* program.

The shell command to execute is set by the lwarp option GlossaryCmd, which defaults to **makeglossaries**. The print or HTML glossary filename is appended to this command.

⚠ *makeglossaries* not found

In some situations it may be required to modify the default command, such as to add the **perl** command in front:

```
\usepackage[
   GlossaryCmd={perl makeglossaries},
] {lwarp}
```

xindy language

To set the language to use for processing glossaries with *xindy*:

```
\usepackage[
   GlossaryCmd={makeglossaries -L english},
] {lwarp}
```

Other options for *makeglossaries* may be set as well.

placement and TOC options

The glossaries may be placed in a numbered or unnumbered section, given a TOC entry, and placed inline or on their own HTML page:

Numbered section, on its own HTML page:

```
\usepackage[xindy,toc,numberedsection=nolabel]{glossaries}
...
\printglossaries
```

Unnumbered section, inline with the current HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\printglossaries
```

Unnumbered section, on its own HTML page:

```
\usepackage[xindy,toc]{glossaries}
...
\ForceHTMLPage
\printglossaries
```

⚠ glossary style — The default `style=item` option for glossaries conflicts with lwarp, so the style is forced to `index` instead.

⚠ number list — The page number list in the printed form would become `\namerefs` in HTML, which could become a very long string if many items are referenced. For now, the number list is simply turned off.

print/HTML versions — The print and HTML versions of the glossary differ in their internal page numbers. Separate commands for generating print and HTML glossaries are used, even though the page number is currently ignored.

for HTML output:

```
\PassOptionsToPackage{xindy}{glossaries}

\LWR@ProvidesPackagePass{glossaries}[2018/07/23]

\setupglossaries{nonumberlist}
\setglossarystyle{index}
```

Patched to fix TOC pointing to the previous page:

```
\renewcommand*{\@p@glossarysection}[2]{%
  \glsclearpage
  \LWR@phantomsection
  \ifdefempty\@@glossarysecstar
  {%
    \csname\@@glossarysec\endcsname{#2}%
  }%
  {%
```

In the original, the TOC entry was made before the section, thus linking to the phantomsection in the printed version, but for HTML, this caused the link to point to the page before the glossaries, which could be a different HTML file. Here, the TOC entry is made after the section is created:

```
      \csname\@@glossarysec\endcsname*{#2}%
    \@gls@toc{#1}{\@@glossarysec}% Moved after the previous line.
  }%
  \@@glossaryseclabel
}
```

lwarp's sectioning commands cannot handle robust macros when splitting HTML into named filenames. glossaries uses `\translate` in sectioning names, and `\translate` is robust and cannot be expanded. The following pre-expands the translations at this moment, making use of `\translatelet`.

```
\newcommand*{\LWR@comp@glossaryname}{\translate{Glossary}}

\ifdefstrequal{\glossaryname}{\LWR@comp@glossaryname}{
    \translatelet\LWR@translatetemp{Glossary}
    \edef\glossaryname{\LWR@translatetemp}
}{}

\newcommand*{\LWR@comp@acronymname}{\translate{Acronym}}

\ifdefstrequal{\acronymname}{\LWR@comp@acronymname}{
    \translatelet\LWR@translatetemp{Acronym}
    \edef\acronymname{\LWR@translatetemp}
}{}
```

```
33
34 \newcommand*{\LWR@comp@glssymbolsgroupname}{\translate{Symbols (glossaries)}}
35
36 \ifdefstrequal{\glssymbolsgroupname}{\LWR@comp@glssymbolsgroupname}{

§ 318.2 Length conversions and graphics options

⚠ whitespace

A scaled image in LaTeX by default takes only as much space on the page as it requires, but HTML browsers use as much space as the original unscaled image would have taken, with the scaled image over- or under-flowing the area.

Handle `alt` key:

```
\define@key{igraph}{alt}{\renewcommand*{\LWR@igalt}{#1}}
```

It appears that graphicx does not have separate keys for `xscale` and `yscale`. `scale` adjusts both at the same time.

```
\define@key{igraph}{scale}{%
    \ifthenelse{\equal{#1}{1}}{}{%  must expand #1
        \PackageNote{lwarp}{%
        It is recommended to use ``[width=xx\protect\linewidth]''\MessageBreak
            instead of ``[scale=yy]'',%
        }%
    }%
    \renewcommand*{\LWR@igxscale}{#1}%
    \renewcommand*{\LWR@igyscale}{#1}%
}
```

Numerous ignored keys:

§ 318.3 Printing HTML styles

`\LWR@rotstyle` {⟨*prefix*⟩} {⟨*degrees*⟩}

Prints the rotate style with the given prefix.

`prefix` is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:rotate` style.

```
\newcommand*{\LWR@rotstyle}[2]{%
    \edef\LWR@tempone{#2}%
    \setcounter{LWR@tempcountone}{-1*\real{\LWR@tempone}} % space
    #1transform:rotate(\arabic{LWR@tempcountone}deg); % space
}
```

`\LWR@scalestyle` {⟨*prefix*⟩} {⟨*xscale*⟩} {⟨*yscale*⟩}

Prints the scale style with the given prefix.

`prefix` is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:scale` style.

```
\newcommand*{\LWR@scalestyle}[3]{%
    #1transform:scale(#2,#3);
}
```

§ 318.4 `\includegraphics`

`\LWR@opacity` For HTML, used only for `\includegraphics`.

`\LWR@opacity` may be set by the transparent package.

```
\def\LWR@opacity{1}
```

`\LWR@imagesizebox` Used to determine the actual image size if needed.

```
\newsavebox{\LWR@imagesizebox}
```

`\LWR@HTML@Gin@setfile` {⟨*w*⟩} {⟨*h*⟩} {⟨*filename*⟩} Sets the parsed filename for HTML output.

```
\newcommand*{\LWR@HTML@Gin@setfile}[3]{%
    \xdef\LWR@parsedfilename{#3}%
}
```

Key [Gin] `class` CSS class for the image.

Define the new class key for the print-mode version of `\includegraphics`, which is enabled inside a `lateximage`.

```
\AtBeginDocument{
\define@key{Gin}{class}{}
}
```

`\LWR@replaceEPSSVG`

Usually, references to EPS files become SVG files, but if the epstopdf package is being used, it automatically converts EPS to PDF, and the following must NOT be done.

```
\AtBeginDocument{
\IfPackageLoadedTF{epstopdf}
{
    \newcommand*{\LWR@replaceEPSSVG}{}
}{%
```

```
    \newcommand*{\LWR@replaceEPSSVG}{%

        \StrSubstitute{\LWR@tempone}{.EPS}{.SVG}[\LWR@tempone]%
    }
}%
}
```

* [⟨*2: options*⟩] [⟨*3: options*⟩] {⟨*4: filename*⟩}

\LWR@ig@useactualimagesize

If formatting for a word processor, find and set the actual image size, without rotation, using PDF instead of SVG to find the original bounding box:

```
\newcommand*{\LWR@ig@useactualimagesize}[4]{%
    \begingroup%

`\LWR@includegraphicsb` * [⟨*2: options*⟩] [⟨*3: options*⟩] {⟨*4: filename*⟩}

graphics syntax is `\includegraphics` * [⟨*llx,lly*⟩] [⟨*urx,ury*⟩] {⟨*filename*⟩}

graphicx syntax is `\includegraphics` [⟨*key values*⟩] {⟨*filename*⟩}

If `#3` is empty, only one optional argument was given, thus graphicx syntax.

If using `\epsfig` or `\psfig` from the epsfig package, `#4` will be `\LWR@epsfig@filename`, which will have been set by the `file` or `figure` keys. Therefore, `#4` must not be used until after the keys have been processed.

```
\NewDocumentCommand{\LWR@includegraphicsb}{s o o m}

Start the image tag on a new line, allow PDF output word wrap:

```

```
    \begin{LWR@setvirtualpage}%

For correct em sizing during the width and height conversions:

```
    \large%
```

Temporarily prevent underfull `\hbox` warnings.

```
    \hbadness=10000\relax%
```

Reset some defaults, possibly will be changed below if options were given:

```
    \setlength{\LWR@igwidth}{0pt}%
    \setlength{\LWR@igheight}{0pt}%
    \renewcommand*{\LWR@igwidthstyle}{}%
    \renewcommand*{\LWR@igheightstyle}{}%

            {\setkeys{igraph}{}}%

```

Fully expand and detokenize the filename, changing the file extension to `.svg` if necessary.

Note that uppercase file extensions are detected and reported as lowercase, so lwarp can only report to the browser lowercase extensions, so all images must have lowercase file extensions.

        bool {LWR@igkeepaspectratio}
    }{\LWR@ig@useactualimagesize{#1}{#2}{#3}{#4}}{}%
```

Create the HTML reference with the graphicspath, filename, extension, alt tag, style, and class:

```
    \LWR@traceinfo{LWR@includegraphicsb: about to create href}%
    \LWR@href{\LWR@parsedfilename}%
    {% start of href

        \LWR@htmltag{\LWR@ig@htmltag}%
    }% end of href
```

Return to original page size and font size:

```
    \end{LWR@setvirtualpage}%
```

Clear the single-use `alt` text:

```
    \gdef\LWR@ThisAltText{}%
    \LWR@traceinfo{LWR@includegraphicsb done}%
}
```

`\includegraphics` `[`⟨*key=val*⟩`]` `{`⟨*filename*⟩`}`

The user should always use no file suffix in the document source.

```

    \ifthenelse{\equal{#1}{r}}{right}{}%

\LWR@originnames {⟨*letters*⟩}

Handle the `origin` key for `\rotatebox`:

```

§ 319 Package graphicx

Pkg graphicx

graphicx is emulated.

graphicx loads graphics, which also loads lwarp-graphics, which remembers the original graphics definitions for use inside a `lateximage`, and then patches them `\AtBeginDocument` for HTML output.

lwarp-graphics handles the syntax of either graphics or graphicx.

grffile is supported as-is. File types known to the browser are displayed, and unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

letter headings

When using *makeindex*, to match the print and HTML output's display of index letter headings, specify the `lwarp.ist` style:

```
\makeindex[options={-s lwarp.ist}]
```

(For HTML the `lwarp.ist` style is used automatically, which displays letter headings. When using *xindy* the default style also displays letter headings.)

Pkg index

index is patched for use by lwarp.

for HTML output:

```
\LWR@ProvidesPackagePass{index}[2004/01/20]

Use \theLWR@autoindex instead of \thepage. \@tempswatrue is used to force an immediate write to the index file instead of waiting until the end of the page.

```
\xpatchcmd{\newindex}

`\AtBeginDocument` lwarp core `\lets` `\@wrindex` to `\LWR@wrindex`. Since the index package has been loaded, `\let` to its version instead:

```
\let\LWR@index@wrindex\@wrindex

§ 347 Package

keyfloat

(*Emulates or patches code by* Brian Dunn.)

Pkg keyfloat

keyfloat is supported with a considerable amount of hacking. (It's a mashup of lwarp, keyfloat, and tocdata.)

⚠ keywrap

If placing a `\keyfig[H]` inside a `keywrap`, use an absolute width for `\keyfig`, instead of `lw`-proportional widths. (The `[H]` option forces the use of a minipage, which internally adjusts for a virtual 6-inch wide minipage, which then corrupts the `lw` option.)

For wrapped figures, overhang and number of lines are ignored.

for HTML output:

```
1 \LWR@ProvidesPackagePass{keyfloat}[2019/09/23]
2
3 \IfPackageAtLeastTF{keyfloat}{2019/09/23}{\relax}{
4     \PackageError{lwarp-keyfloat}

7         Update to keyfloat v2.01 2019/09/23 or later%
8     }
9     {%
10        Please update the keyfloat package.  It's worth it!%
11    }
12 }
```

After keyfloat has loaded:

```

§ 349 Package kpfonts

(*Emulates or patches code by* Christophe Caignaert.)

Pkg kpfonts

kpfonts is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations

The MathJax emulation honors the options uprightRoman for \D only, classicReIm, frenchstyle for Greek only, upright for Greek only, uprightgreeks, slantedGreeks, and mathcalasscript.

The dedicated macros for Greek work correctly.

svg math should appear the same as the printed output.

§ 350 Package

kpfonts-otf

(*Emulates or patches code by* Daniel Flipo.)

Pkg kpfonts-otf

kpfonts-otf is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations

The MathJax emulation honors the options `fancyReIm`, `mathcal`, `frenchstyle` for Greek only, and `mathcalasscript`.

Also see the options for unicode-math, which is loaded by kpfonts-otf.

The unicode-math dedicated macros for Greek work correctly.

⚠ `\mathversion`

The MathJax emulation does not change with the use of `\mathversion`. Whatever emulation is established at the begin of the document will remain.

SVG math should appear the same as the printed output.

§ 358 Package

libertinust1math

(*Emulates or patches code by* Michael Sharpe.)

Pkg libertinust1math

libertinust1math is used as-is for svg math, and is emulated for MathJax.

The MathJax emulation honors `frenchmath` for Greek but not Latin characters, and `slantedGreek`, `uprightGreek`, and `ISO` also adjust Greek characters. MathJax cannot yet honor options for adjusting Latin characters.

The dedicated macros for upright and italic Greek letters do work correctly.

Some of the symbol font macros such as `\mathsfbf` do not use a sans font because MathJax does not yet have sans Greek.

svg math honors all font choices, and should appear the same as the printed output.

(*Emulates or patches code by* Carsten Heinz, Brooks Moses, Jobst Hoffmann.)

Pkg listings

Force flexible columns. Fixed columns inserts spaces in the PDF output.

\let\LWR@origlsthkEveryPar\lsthk@EveryPar

\renewcommand{\l@lstlisting}[2]{\hypertocfloat{1}{lstlisting}{lol}{#1}{#2}}
```

\lstset {⟨*options*⟩}

Use the listings `literate` option to replace HTML entities:

```
\def\lstset@#1{\endgroup%
%  \ifx\@empty#1%
%         \@empty%
%     \else%
        \setkeys{lst}{%

            {'}{\HTMLentity{apos}}{6}%
            {`}{\HTMLentity{grave}}{7}%
```

The ampersand is not treated here, as the result is inconsistent spacing. It is nevertheless converted to `&` elsewhere. Sanitizing the double quote interferes with listings' conversion of visible spaces inside strings.

```
        }%

lyluatex

(*Emulates or patches code by* Fr. Jacques Peron, Urs Liska, Br. Samuel Springuel.)

Pkg lyluatex

lyluatex is patched for use by lwarp.

For the first compile, to set *lwarpmk*'s configuration, use:

```
lualatex --shell-escape <filename>
```

⚠ images

After compiling the document with **lwarpmk html**, use **lwarpmk limages** to convert the Lilypond images for HTML.

CSS

The option `insert=systems` results in an image per system. Each music image "system" is placed inside a `<span>` of class `lyluatex`, which defaults to `display: inline-block`.

⚠ `insert=fullpage`
CSS

The option `insert=fullpage` results in a single image per page of printed output. Each music "fullpage" image is placed inside a `<div>` of class `lyluatex`. To

match the number of measures per line with the printed version, use the geometry package to select the page geometry, or use the lyluatex options for page and staff sizes.

⚠ options To use `\linewidth` or `\textwidth` inside the package options for lyluatex, use the kvoptions-patch package first:

```
\usepackage{kvoptions-patch}
\usepackage[...,line-width-0.8\linewidth,...]{lyluatex}
```

⚠ raw-pdf If using `raw-pdf`, the resulting PDF images must be converted to SVG:

Enter ⇒ **`lwarpmk pdftosvg tmp-ly/*.pdf`**

for HTML output:

```
\LWR@origRequirePackage{luacode}

\LWR@ProvidesPackagePass{lyluatex}[2019/05/27]
```

User-redefinable `ALT` tag:

```
\newcommand*{\LyluatexImageAltText}{-lilypond-~\PackageDiagramAltText}
```

`\ly@compilescore` {⟨*Lilypond object*⟩}

```
\LetLtxMacro\LWR@orig@ly@compilescore\ly@compilescore

\renewcommand*{\ly@compilescore}[1]{%
```

A local group holds a number of changes:

```
    \begingroup%
```

The user's original geometry and font size are restored to match the print version. This allows for correct spacing in the musical score.

```
    \LWR@maybe@orignewpage%
    \LWR@origloadgeometry{LWR@usergeometry}%
    \LWR@print@normalsize%
```

A local group holds a redefined `\includegraphics` which is used by *lyluatex.lua* to insert the *Lilypond* score if `insert=systems` is used. This is now placed inside a `lateximage`, which itself is placed inside a of class `lyluatex`.

`\LWR@addbaselinemarker` preserves the left margins.

```
    \renewcommand{\includegraphics}[2][]{%
        \InlineClass{lyluatex}{%
            \begin{lateximage}[\LyluatexImageAltText]%
            \LWR@addbaselinemarker%
            \LWR@origincludegraphics{##2}%
            \end{lateximage}%
        }%
    }%
```

From the original:

```
    \ly@setunits%
    \directlua{
        ly_opts:set_option('currfiledir', [[\currfiledir]])
        ly_opts:set_option('twoside', '\ly@istwosided')
        #1
    }%
```

```
    \ly@resetunits%
    \ly@currentfonts%
```

The fullpage version is set inside an HTML :

```
    \directlua{
        if (ly.score.insert == 'fullpage') then
            tex.print{[[\string\begin{BlockClass}{lyluatex}]]}
        end
    }%
```

Generate the score:

```
    \directlua{ly.score:process()}%
```

Close the :

```
    \directlua{
        if (ly.score.insert == 'fullpage') then
            tex.print{[[\string\end{BlockClass}]]}
        end
    }%
```

Move to a new page and renew the regular page geometry:

```
    \LWR@maybe@orignewpage%
    \LWR@origrestoregeometry%
```

End of the local group.

```
    \endgroup%
}
```

In HTML the following generates an error, so is removed:

```
\xpatchcmd{\endly@bufferenv}
    {\hspace{0pt}\\}
    {}
    {}
    {\LWR@patcherror{lyluatex}{endly@bufferenv}}

§ 384 Package

manyfoot

Pkg manyfoot

manyfoot is emulated.

bigfoot, manyfoot

⚠ verbatim

Verbatim footnotes are not yet supported.

If using the bigfoot package, and possibly also manyfoot, problems may occur with counter allocation because lwarp uses many counters, and there is a difference in how counters numbered 256 and up are handled in pdf LaTeX. With bigfoot this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining bigfoot or manyfoot footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use XeLaTeX or LuaLaTeX instead of pdf LaTeX.

lwarp's emulation of bigfoot uses manyfoot, so some of the bigfoot enhancements are included here.

The bigfoot "default" footnote is ignored, using the lwarp version instead.

File 290 **lwarp-mathtools.sty**

§ 399 Package

mathtools

(*Emulates or patches code by* Morten Høgholm, Lars Madsen.)

Pkg mathtools

⚠ equation numbering

mathtools is patched for use by lwarp. Emulation macros are provided for MathJax.

showonlyrefs is disabled, as it conflicts with cleveref, which is used by lwarp. Equation numbers may not match the print version.

⚠ italic correction

mathic is not emulated for HTML.

⚠ MathJax

If using MathJax:

- mathtools disallowspaces does not work for MathJax. Protect brackets which are not optional arguments, such as:

  ```
  \begin{gathered}{}
  [p]=1 . . .
  \end{gathered}
  ```

- showonlyrefs does not work in MathJax, and will result in a difference in equation numbering compared to the print version.
- alignat in MathJax requires math mode, but in LaTeX it doesn't. It may be required to use warpHTML and warpprint to isolate a version for each mode.
- `\DeclarePairedDelimiter` and related must be in the preamble before `\begin{document}`.

for HTML output:

```
\LWR@ProvidesPackagePass{mathtools}[2018/01/08]

\RequirePackage{graphicx}

\MHInternalSyntaxOn
```

Forces showonlyrefs off because lwarp uses cleveref, which is not compatible with showonlyrefs.

```

§ 401 Package maybemath

(*Emulates or patches code by* Andy Buckley.)

Pkg maybemath

Pkg mcaption

mcaption is ignored.

for HTML output:

Discard all options for lwarp-mcaption:

\newenvironment{margincap}{}{}
\newcommand*{\margincapalign}{}
\newlength{\margincapsep}
```

File 294 **lwarp-mdframed.sty**

§ 403 Package mdframed

(*Emulates or patches code by* Marco Daniel, Elke Schubert.)

Pkg mdframed

mdframed is loaded with options forced to `framemethod=none`.

§ 403.1 Limitations

support

Most basic functionality is supported, including frame background colors and single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for mdframed environments and frame titles.

⚠ loading

When used, lwarp loads mdframed in HTML with `framemethod=none`.

font

For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the mdframed source). Since lwarp does not support `\bfseries` and friends, only one font selection may be made at a time.

theoremtitlefont

`theoremtitlefont` is not supported, since the following text is not in braces in the mdframed source.

ignored options

`userdefinedwidth` and `align` are currently ignored.

css classes

Environments created or encapsulated by mdframed are enclosed in a `<div>` of class `mdframed`, and also class `md<environmentname>` for new environments.

Frame titles are placed in a of class |mdframedtitle|. Subtitles are in a of class |mdframedsubtitle|, and likewise for subsubtitles.

Pre-existing hooks are used to patch extra functions before and after the frames.

§ 403.2 Package loading

for HTML output:

```
\RequirePackage{xcolor}% for \convertcolorspec

\LWR@ProvidesPackageDrop{mdframed}[2013/07/01]
```

Do not require Ti*k*z or pstricks:

```
\LWR@origRequirePackage[framemethod=none]{mdframed}
```

§ 403.3 Patches

Patch to remove PDF formatting and add HTML tags:

```
\AtBeginDocument{
\def\mdf@trivlist#1{%
  \edef\mdf@temp{%
%     \topsep=\the\topsep\relax%
%     \partopsep=\the\partopsep\relax%
%     \parsep=\the\parsep\relax%

}

\renewcommand*{\endmdf@trivlist}{%
\LWR@traceinfo{endmdf@trivlist}%
% \endtrivlist%
\LWR@listend%
}
}% AtBeginDocument
```

§ 403.4 Initial setup

To handle css and paragraphs, patch code at start and end of environment and contents. \LWR@print@raggedright helps avoid hyphenation.

```
\mdfsetup{
startcode={\LWR@mdframedstart\LWR@print@raggedright},
endcode={\LWR@mdframedend},
startinnercode={\LWR@startpars\LWR@print@raggedright},
endinnercode={\LWR@stoppars},
}
```

§ 403.5 Color and length HTML conversion

\LWR@mdfprintcolor {⟨*mdfcolorkey*⟩}

Given the mdframed key, print the color.

```
\newcommand*{\LWR@mdfprintcolor}[1]{%
\convertcolorspec{named}{\@nameuse{mdf@#1}}{HTML}\LWR@tempcolor%
\LWR@origpound\LWR@tempcolor
}
```

\LWR@mdfprintlength {⟨*mdflengthkey*⟩}

Given the mdframed key, print the length.

```
\newcommand*{\LWR@mdfprintlength}[1]{%
\LWR@forceminwidth{\@nameuse{mdf@#1@length}}%
\LWR@printlength{\LWR@atleastonept}%
}
```

§ 403.6 Environment encapsulation

\LWR@mdframedstart Actions before an mdframe starts.

Encapsulate a frame inside a of the desired class.

```
\newcommand*{\LWR@mdframedstart}{%
\LWR@traceinfo{LWR@mdframedstart start}%
```

Warn if starting a frame inside a :

```
    \LWR@spanwarninvalid{mdframe}%
```

Turn off paragraph handling during the generation of the encapsulating tags:

```
\LWR@stoppars%
```

Open a and with custom class and custom style. A BlockClass environment is not used because this is created by the mdframed startcode and endcode settings, which do not properly nest the inside the mdframed environment.

```
\LWR@htmltagc{div class=\textquotedbl%
mdframed%
\ifdefstring{\LWR@mdthisenv}{mdframed}{}{ \LWR@mdthisenv}%
\textquotedbl \LWR@orignewline
style=\textquotedbl\LWR@orignewline
```

Convert and print the background color:

```
background: \LWR@mdfprintcolor{backgroundcolor} ; \LWR@orignewline

Convert and print the border color and width:

```
border: \LWR@mdfprintlength{linewidth} solid
\LWR@mdfprintcolor{linecolor} ; \LWR@orignewline
```

Convert and print the border radius:

```
border-radius: \LWR@mdfprintlength{roundcorner} ; \LWR@orignewline

}
{box-shadow: none ;}
\LWR@orignewline

\textquotedbl}
% \LWR@htmldivclass{\LWR@mdthisenv}
```

mdframed environment may not work with the HTML versions of the following, so restore them to their originals while inside mdframed:

```
\LWR@select@print@hspace%
\renewcommand*{\rule}{\LWR@print@rule}
\LetLtxMacro\makebox\LWR@print@makebox%

\LWR@startpars%
\LWR@traceinfo{LWR@mdframedstart done}%
}
```

\LWR@mdframedend

Actions after an mdframe ends.

After closing the , globally restore to the default environment type:

```
\newcommand*{\LWR@mdframedend}{
\LWR@traceinfo{LWR@mdframedend start}%
```

Close the custom :

```
\LWR@htmldivclassend{\LWR@mdthisenv}
```

Reset future custom class to the default:

```
\gdef\LWR@mdthisenv{mdframed}
```

Resume paragraph handling:

```
\LWR@startpars%
\LWR@traceinfo{LWR@mdframedend done}%
}
```

File 296 **lwarp-media9.sty**

§ 405 Package

media9

Pkg media9

media9 is emulated.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

⚠ & in a URL

Many special characters are converted to regular catcode 12 characters for use inside a URL. & is used in the flash variables fields, which are split with xparse \SplitList, which does not seem to work with a catcode 12 divider token, so & is not converted to catcode 12, and will not work in a URL with media9. Using & in a URL in a flashvars field may also cause parsing problems with print output, as well.

File 301 **lwarp-mhchem.sty**

§ 410 Package

mhchem

(*Emulates or patches code by* Martin Hensel.)

Pkg mhchem

mhchem is patched for use by lwarp.

without MathJax

Without MathJax, mhchem expressions are converted to svg math. Inline expressions use hashed filenames to allow reuse, and assume that any mhchem options are global.

MathJax with mhchem extension

For MathJax, the mhchem extension is used if the mhchem expression is used inside a math expression:

```
$\ce{C6H5-CHO}$
```

To force the use of svg math for an expression which does not work with MathJax, place the expression between `\displaymathother` and `\displaymathnormal`:

```
\displaymathother
\[ \ce{ . . . } \]     . . .     $ \ce { . . . } $
\displaymathnormal
```

not inside math

If *not* used inside a math expression, lwarp converts standalone mhchem expressions into svg math images.

⚠ nested math

When producing html output without the MathJax mhchem extension, lwarp does not support the use of nested dollar signs in mhchem expressions.

For some examples from the mhchem manual, change as follows:

```
$\ce{NaOH(aq,$\infty$)}$            % old
$\ce{NaOH(aq,\infty)}$              % new

$\ce{Fe(CN)_{$\frac{6}{2}$}$}$      % old
$\ce{Fe(CN)_{\frac{6}{2}}}$         % new

$\ce{NO_$x$}$                       % old
$\ce{NO_x}$                         % new

$\ce{NO_${x}$}$                     % old
$\ce{NO_{x}}$                       % new

$\ce{$cis${-}[PtCl2(NH3)2]}$        % old
$\ce{\mathit{cis}{-}[PtCl2(NH3)2]}$ % new
```

for HTML output:

minted is patched for use by lwarp.

⚠ limitations

mathescape and highlightlines don't work. Line numbers on the right will not be aligned. Due to *pdftotext*, extra spaces may appear in broken lines if other formatting is included.

§ 417 Package

mismath

(*Emulates or patches code by* Antoine Missier.)

Pkg mismath

mismath is patched for SVG math, and emulated for MathJax.

⚠ MathJax

`\enumber`, `\inumber`, `\jnumber`, and `\pinumber` are ignored for MathJax, except that `\itpi` is made available as a clone of `\pi`.

For MathJax, `\boldvect` and `\arrowvect` are honored if in the preamble.

If `\boldvectcommand` is set to `\mathbf` in the preamble, it will be used for MathJax, otherwise it will default to `\mathit`. `\boldvectcommand` may also be set with `\CustomizeMathJax` in the preamble. See section 8.7.6. Note that as of this writing there is not a bold italic font across all MathJax fonts.

If `\probastyle` is set to `\mathbb` in the preamble, it will be used for MathJax, otherwise it will default to `\mathrm`. `\probastyle` may be set with `\CustomizeMathJax` in the preamble.

If `\mathset` is set to `\mathbb` in the preamble, it will be used for MathJax, otherwise it will default to `\mathbf`. `\mathset` may be set with `\CustomizeMathJax` in the preamble.

for HTML output:

§ 421 Package movie15

Pkg movie15

movie15 is emualted.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 `\addmediapath` is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each `<audio>` and `<video>` object.

media9 slideshows are not supported.

`\hyperlinkmovie`, `\movieref`, and `\mediabutton` are not supported.

3D objects are not supported.

File 320 **lwarp-multirow.sty**

§ 429 Package multirow

(*Emulates or patches code by* Piet van Oostrum, Øystein Bache, Jerry Leichter.)

Pkg multirow

multirow is emulated during HTML output, and used as-is while inside a `latexmage`.

vposn

- Note that recent versions of multirow include a new optional vposn argument.

multirow cells

- For multirow, insert `\mrowcell` into any empty multi-row cells. This will be a null function for the print output, and is a placeholder for parsing the table for HTML output. An error is generated if this is missed.

```
... &  \multirow{2}{.5in}{text}  & ...
... &  \mrowcell                 & ...
```

colored cells

- The multirow documentation regarding colored cells recommends using a negative number of rows. This will not work with lwarp, so `\warpprintonly` and `\warpHTMLonly` must be used to make versions for print and HTML.

with `\multicolumn`

- See section 429.2 for `\multicolumrow`.

⚠ `\multicolumn` & `\multirow`

lwarp does not support directly combining `\multicolumn` and `\multirow`. Use `\multicolumnrow` instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for `\multicolumn` come first, followed by the five arguments for `\multirow`, many of which are optional, followed by the contents.

⚠ skipped cells

⚠ empty cells

As per `\multirow`, skipped cells to the right of the `\multicolumnrow` statement are not included in the source code on the same line. On the following lines, `\mcolrowcell` must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

```
... &  \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}  & ...
... &  \mcolrowcell          &          \mcolrowcell   & ...
... &  \mcolrowcell          &          \mcolrowcell   & ...
```

⚠ MathJax

- MathJax does not support multirow, so it is emulated to only print its text on the first row. `\multirow` works as expected in text `tabulars` or SVG math.

In a `lateximage`, the print versions are restored.

See section 75.24 for the print-mode versions.

for HTML output:

Remove the placeholder macro which was used if multirow was not loaded:

```
\LetLtxMacro\multirow\relax
```

```
\LWR@ProvidesPackagePass{multirow}[2021/03/15]
```

`\LWR@multirowborder`

Set to `left` or `right` to create a thick border for the cell, for use by bigdelim:

```
\newcommand{\LWR@multirowborder}{}
```

§ 429.1 Multirow

\LWR@multirow@par

\par inside a \multirow.

```
\newcommand*{\LWR@multirow@par}{%

Print the start of a new table data cell:

```
    \LWR@htmltag{%
        td rowspan=\textquotedbl#2\textquotedbl\ %
```

A class adds the column spec and the rule:

```
        class=\textquotedbl{}td%
```

Append this column's spec:

```
      \LWR@getexparray{LWR@tablecolspec}{\arabic{LWR@tableLaTeXcolindex}}%
```

If this column has a cmidrule, add "rule" to the end of the HTML class tag. Also add the vertical bar class.

```
        \LWR@addcmidruletrim%
        \LWR@addleftmostbartag%
        \LWR@printbartag{\arabic{LWR@tableLaTeXcolindex}}%
        \textquotedbl%

        \LWR@tdstartstyles%
```

The vertical alignment, if given:

```
    \ifstrequal{#1}{c}{\LWR@tdaddstyle\LWR@print@mbox{vertical-align:middle}}{}%
    \ifstrequal{#1}{b}{\LWR@tdaddstyle\LWR@print@mbox{vertical-align:bottom}}{}%

While printing the text, redefine `\\` to generate a new line. If a nested `tabular` occurs, `\\` is redefined to `\LWR@tabularendofline` at the start of the `tabular`, then `\LWR@endofline` before again printing any `\multirow` contents inside the nested `tabular`.

`\par` is redefined to insert an HTML break, and if `tabular` is nested, it is redefined at the start of `tabular`.

`\IfPackageLoadedTF{multirow}` determines if v2.0 or later of multirow was used, which included the `\ProvidesPackage` macro.

The HTML version follows.

`\AtBeginDocument` because the print version had to see if multirow was loaded before determining how to define `\LWR@print@multicolumnrow`.

\defaddtocounter{LWR@tableLaTeXcolindex}{-1}%

Skip any trailing `@` or `!` columns for this cell:

§ 431 Package musicography

(*Emulates or patches code by* Andrew A. Cashner.)

Pkg musicography

musicography is patched for use by lwarp.

Images are used for the meter symbols and fingered bass, since the HTML fonts tend not to be the correct size and HTML cannot stack items. The HTML `alt` tag copies `C` and `3/2`, etc. Hashes are used for the meter images, which are then reused as necessary.

⚠ Note that browser support for musical symbols may be buggy. ALT text and copy/paste into a text editor work well.

§ 442 Package

newtxsf

(*Emulates or patches code by* Michael Sharpe.)

Pkg newtxsf

newtxsf is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations

The MathJax emulation ignores all package options, except `slantedGreek` is honored. The dedicated macros for upright and italic Greek and bold italic Latin letters do work correctly.

SVG math should appear the same as the printed output.

for HTML output:

```

§ 444 Package nfssext-cfr

(*Emulates or patches code by* Clea F. Rees.)

Pkg nfssext-cfr

nfssext-cfr is emulated in HTML, and used as-is in print output.

Results depend on the browser's font.

for HTML output:

```
\LWR@ProvidesPackagePass{nfssext-cfr}[2017/03/28]

Macros which are present in the lwarp core are commented out here.

File 338 **lwarp-nicematrix.sty**

§ 447 Package nicematrix

(*Emulates or patches code by* F. Pantigny.)

Pkg nicematrix

nicematrix is used as-is for SVG math, and is emulated for MathJax.

⚠ MathJax Keys/values are ignored in MathJax. `\Cdots`, etc. do not span multiple cells. `AutoNiceMatrix`, etc. are not supported for MathJax. SVG math output preserves all nicematrix features. To force SVG output for one or more consecutive math expressions, for inline math use `\inlinemathother` and `\inlinemathnormal`, or for display math use `\displaymathother` and `\displaymathnormal`.

for HTML output:

```
\LWR@ProvidesPackagePass{nicematrix}[2020/11/23]
```

`NiceTabular` must be converted to SVG to support the various nicematrix options:

```
\begin{warpHTML}
\BeforeBeginEnvironment{NiceTabular}{%
    \begin{lateximage}[-nicematrix-~\PackageDiagramAltText]%
}
\AfterEndEnvironment{NiceTabular}{\end{lateximage}}
\BeforeBeginEnvironment{NiceTabular*}{%
    \begin{lateximage}[-nicematrix-~\PackageDiagramAltText]%
}
\AfterEndEnvironment{NiceTabular*}{\end{lateximage}}
\end{warpHTML}
```

Special handling for the optional arguments, and the lack of a delimiter:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\LWRnicearrayarray}[1]{\begin{array}{#1}}}
\CustomizeMathJax{\def\LWRnicearrayarrayopt#1[#2] {\begin{array}{#1}}}

\CustomizeMathJax{%
    \newenvironment{NiceArray}[2][]%
        {\ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}}%
        {\end{array}}%
}

\CustomizeMathJax{%
    \newcommand{\LWRnicearraywithdelimtwo}[2][]{%
        \ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}%
    }%
}
```

General case with left / right delimiters:

```
\CustomizeMathJax{%
    \newenvironment{NiceArrayWithDelims}[2]%
        {%
            \def\LWRnicearrayrightdelim{\right#2}%
            \left#1%
            \LWRnicearraywithdelimtwo%
        }%
        {\end{array}\LWRnicearrayrightdelim}%
}
```

Instances of specific delimiters:

```
\CustomizeMathJax{%
    \newenvironment{pNiceArray}
        {\begin{NiceArrayWithDelims}{(}{)}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{bNiceArray}
        {\begin{NiceArrayWithDelims}{[}{]}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{BNiceArray}
        {\begin{NiceArrayWithDelims}{\{}{\}}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{vNiceArray}
        {\begin{NiceArrayWithDelims}{\vert}{\vert}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{VNiceArray}
        {\begin{NiceArrayWithDelims}{\Vert}{\Vert}}
        {\end{NiceArrayWithDelims}}
```

```
}
```

Ignore optional arg and use standard environments:

```
\CustomizeMathJax{\newenvironment{NiceMatrix}[1][]{\begin{matrix}}{\end{matrix}}}
\CustomizeMathJax{\newenvironment{pNiceMatrix}[1][]{\begin{pmatrix}}{\end{pmatrix}}}
\CustomizeMathJax{\newenvironment{bNiceMatrix}[1][]{\begin{bmatrix}}{\end{bmatrix}}}
\CustomizeMathJax{\newenvironment{BNiceMatrix}[1][]{\begin{Bmatrix}}{\end{Bmatrix}}}
\CustomizeMathJax{\newenvironment{vNiceMatrix}[1][]{\begin{vmatrix}}{\end{vmatrix}}}
\CustomizeMathJax{\newenvironment{VNiceMatrix}[1][]{\begin{Vmatrix}}{\end{Vmatrix}}}
```

Ignore optional argument and size. Print contents.

```
\CustomizeMathJax{\newcommand{\LWRnicematrixBlock}[1]{#1}}
\CustomizeMathJax{\def\LWRnicematrixBlockopt<#1>#2{#2}}

\CustomizeMathJax{%
   \newcommand{\Block}[2][]{\ifnextchar<\LWRnicematrixBlockopt\LWRnicematrixBlock}%
}
```

Form an approximation:

```
\CustomizeMathJax{%
    \newcommand{\diagbox}[2]{%
        \begin{array}{l}\hfill\quad#2\\\hline#1\quad\hfill\end{array}%

Pkg ntheorem

Table 20: Ntheorem package — css styling of theorems and proofs

Theorem: of class theorembody<theoremstyle>

Theorem Header: of class theoremheader<style>

where <theoremstyle> is plain, break, etc.

§ 457.1 Limitations

⚠ Font control

This conversion is not total. Font control is via css, and the custom LaTeX font settings are ignored.

⚠ Equation numbering

ntheorem has a bug with equation numbering in $\mathcal{AMS}$ environments when the option thref is used. lwarp does not share this bug, so equations with \split, etc, are numbered correctly with lwarp's html output, but not with the print output. It is recommended to use cleveref instead of ntheorem's thref option.

§ 457.2 Options

Options amsthm or standard choose which set of theorems and proofs to initialize.

⚠ Disabled options

The options thmmarks and amsmath are disabled, since they heavily modify the underlying math code. Theorem marks are emulated. The AMS-math modifications are not done.

Option thref is disabled because cleveref functions are used instead. \thref is emulated.

Option hyperref is disabled because lwarp emulated hyperref.

for HTML output:

Some disabled options:

```
\DeclareOption{thref}{
    \AtEndDocument{
        \PackageWarningNoLine{lwarp}{%
            Lwarp uses cleveref, which takes over ntheorem's\MessageBreak
            referencing, including
                \protect\label \space and \protect\thref.\MessageBreak
            Cleveref does not accept ntheorem's optional\MessageBreak
            argument for \protect\label, so it will appear\MessageBreak
```

```
            in the text.  It is recommended to remove the\MessageBreak
          thref option, \protect\usepackage{cleveref} instead,\MessageBreak
            and remove any trailing optional arguments for \protect\label%

(*Emulates or patches code by* Rolf Niepraschk.)

Pkg overpic

overpic is patched for use by lwarp.

⚠ scaling

The macros `\overpicfontsize` and `\overpicfontskip` are used during HTML generation. These are sent to `\fontsize` to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the `overpic` and `Overpic` environments.

See section 88.2 for the print-mode version of `\overpicfontsize` and `\overpicfontskip`.

§ 482 Package pdfrender

Pkg pdfrender pdfrender is allowed during HTML, but it has no effect on HTML text output. pdfrender is enabled for use with xfakebold, and it is enabled during HTML so that it may be in use when an SVG math image is started. I.e. xfakebold's `\setBold` may be used outside of a math expression and still be detected when the math begins.

The lwarp-pdfrender package is present because it used to disable pdfrender, so this newer version is to overwrite older versions.

⚠ convert image files

The pdftricks image files <jobname>-fig*.pdf must be converted to .svg, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

File 377 **lwarp-perpage.sty**

§ 486 Package

perpage

(*Emulates or patches code by* David Kastrup.)

Pkg perpage

perpage is mostly ignored, but support is added for footnote counters.

There is no page number in HTML, so most counters are not reset. If the document redefines \the<countername> to include \theperpage, it is necessary to place that redefininition inside a warpprint environment to avoid modifying the HTML defintions.

\AddAbsoluteCounter must not be inside warpprint, as the counter must be added for HTML also, although it is not incremented.

footnote numbering

To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For bigfoot, manyfoot, or perpage:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by FootnoteDepth, which is not necessarily by HTML page. This is recommended for \alph, \Alph, or \fnsymbol footnotes, due to the limited number of symbols which are available.

for HTML output:

```
\LWR@ProvidesPackageDrop{perpage}[2014/10/25]

File 410 **lwarp-relsize.sty**

§ 519 Package

relsize

(*Emulates or patches code by* Donald Arseneau, Bernie Cosell, Matt Swift.)

Pkg relsize

relsize is patched for use by lwarp, and emulated for MathJax.

For HTML, only the inline macros are supported: \textlarger, \textsmaller, and \textscale. Each becomes an inline span of a modified font-size.

\relsize, \larger, \smaller, and \relscale are ignored.

While creating SVG math for HTML, the original definitions are temporarilty restored, and so should work as expected.

⚠ not small

The HTML browser's setting for minumum font size may limit how small the output will be displayed.

for HTML output:

§ 520 Package

repeatindex

Pkg repeatindex

repeatindex is emulated for lwarp.

⚠ style file

lwarp must be used with a special style file:

```
\usepackage[makeindex,makeindexStyle={lwarp_repeatindex}]{lwarp}
```

where `lwarp_repeatindex.ist` may be copied from the following modified version of `lwarp.ist`:

```
preamble
"\\begin{theindex}

item_0 "\n  \\item ["
```

(The modifications are the `delim_0` and `item_0` entries.)

for HTML output:

```
\LWR@ProvidesPackageDrop{repeatindex}[2001/10/13]
```

In the lwarp core, `\LWR@indexitem` is modified to accept the optional `\item` argument.

```

File 421 **lwarp-rotfloat.sty**

§ 530 Package

rotfloat

(*Emulates or patches code by* Axel Sommerfeldt.)

Pkg rotfloat

rotfloat is emulated.

for HTML output:

```
\LWR@ProvidesPackageDrop{rotfloat}[2004/01/04]

\RequirePackage{float}
\RequirePackage{rotating}
```

\newfloat {⟨*1: type*⟩} {⟨*2: placement*⟩} {⟨*3: ext*⟩} [⟨*4: within*⟩]

Emulates the \newfloat command from the float package. Sideways floats are \let to the same as regular floats.

"placement" is ignored.

```
\RenewDocumentCommand{\newfloat}{m m m o}{%
\IfValueTF{#4}%
{%
    \DeclareFloatingEnvironment[fileext=#3,within=#4]{#1}%
}%
{%
    \DeclareFloatingEnvironment[fileext=#3]{#1}%
}%
\csletcs{sideways#1}{#1}%
\csletcs{endsideways#1}{end#1}%
```

Remember the float style:

```
\csedef{LWR@floatstyle@#1}{\LWR@floatstyle}%
\csedef{LWR@floatstyle@sideways#1}{\LWR@floatstyle}%
```

newfloat package automatically creates the `\listof` command for new floats, but float does not, so remove `\listof` here in case it is manually created later:

```
\cslet{listof#1s}\relax%
\cslet{listof#1es}\relax%
\cslet{listofsideways#1s}\relax%
\cslet{listofsideways#1es}\relax%
}

seqsplit

(*Emulates or patches code by* Boris Veytsman.)

Pkg seqsplit

seqsplit is patched for use by lwarp.

For HTML output, the results are similar to print mode, and respond to window size.

⚠ SVG math results

For SVG math, the output differs from print mode in that the contents are formatted in a minipage, which is then inline with the surrounding math.

For MathJax, the contents are used as-is.

for HTML output:

```
\LWR@ProvidesPackagePass{seqsplit}[2006/08/07]
```

Special handling because lwarp uses a box for SVG math, which does not normally allow line breaks, so a print-mode `minipage` must be used to allow line breaks. The `minipage` will not be wrapped inline with any surrounding math.

```
\begin{warpHTML}
\LetLtxMacro\LWR@orig@seqsplit\seqsplit

\renewcommand*{\seqsplit}[1]{%

  {\end{KFLTsidenotes@marginfloat}}
```

The following were changed by sidenotes, and now are reset back to their lwarp-supported originals:

Restoring the definition from the LaTeX 2ε `article.cls` source:

```
\renewenvironment{figure*}
```

```
                {\@dblfloat{figure}}
                {\end@dblfloat}

\renewenvironment{table*}
                {\@dblfloat{table}}
                {\end@dblfloat}
```

For MathJax:

⚠ Note that sidenotes does not support `\sidenote` inside math in print mode. Use `\sidenotemark` and `\sidenotetext` instead.

```
\begin{warpMathJax}
\providecommand{\sidenotename}{sidenote}

\CustomizeMathJax{\newcommand{\sidenotemark}[1][\LWRsidenote]{{}^{\mathrm{#1}}}}
\end{warpMathJax}
```

The following is not defined since is not allowed inside math in print mode, and also would have to be modified to parse the optional offset argument:

```
\CustomizeMathJax{\newcommand{\sidenote}[2][\LWRsidenote]{{}^{\mathrm{#1}}}}

File 451 **lwarp-SIunits.sty**

§ 560 Package

SIunits

(*Emulates or patches code by* Marcel Heldoorn.)

Pkg SIunits

SIunits is patched for use by lwarp.

For SVG math, it is recommended to use `\unit` where possible, which combines the entire expression into a single `lateximage`, and adds the `alt` tag containing the LaTeX code, allowing for copy/paste. When units are used outside of the `\unit` macro, each unit macro will have its own `lateximage`, and each will have the `alt` tag set according to `\MathImageAltText`, which defaults to `(math image)`.

For MathJax, individual units used in text will appear as SVG images, since `\ensuremath` is used in the original defintions, and `\ensuremath` often has expressions which do not work well in MathJax, so it is always forced to an SVG image. If, however, `\unit` is used, the result is expressed with MathJaxinstead of an SVG image.

§ 562 Package

siunitx-v2

(*Emulates or patches code by* Joseph Wright.)

Pkg siunitx-v2

siunitx-v2 is patched for use by lwarp, and is emulated for MathJax.

siunitx is well supported by lwarp.

Limitations Some general limitations:

fractions Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

`\cancel` is not currently supported for siunitx v3.

Negative values are not automatically colored.

⚠ tabular Tabular `S` and `s` columns are rendered as simple `c` columns, although key settings will be set. If using scientific notation, `table-format`, `table-align-uncertainty`, `drop-exponent`, etc.. use `\tablenum` for each cell. This is especially required for

⚠ drop-exponent `drop-exponent`, without which the value will be shown incorrectly.

⚠ table-auto-round `table-auto-round` is ignored.

Math rendering Math may be rendered in several ways in the same document:

For math mode with SVG display: The original siunitx code is used while generating the SVG image.

For HTML text mode: lwarp uses siunitx code patched for HTML, and simplified units.

For math expressions while using MathJax: A limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. The result usually looks fine, and otherwise is enough to get the meaning across.

Custom units siunitx allows customized units:

`\DeclareSIUnit` `{`⟨*name*⟩`}` `{`⟨*definition*⟩`}`

`\DeclareSIUnit` declares a version of the unit for the print version. This is also used when the unit is printed in SVG math or a `lateximage`. It is also used for HTML if an HTML-specific version is not defined with `\HTMLDeclareSIUnit`.

```
\DeclareSIUnit\myunit{\ensuremath{\text{m}_y}}
```

`\HTMLDeclareSIUnit` `{`⟨*name*⟩`}` `{`⟨*definition*⟩`}`

⚠ v3 only! Use this after the print unit has been defined. For siunitx v3, `\HTMLDeclareSIUnit` declares a simplified version of the unit for HTML, for example if the print-mode unit uses TEX boxes or `\ensuremath`:

```
\HTMLDeclareSIUnit\myunit{\text{m}\textsubscript{\textit{y}}}
```

It is also possible to provide a custom unit for MathJax:

```
\CustomizeMathJax{\newcommand{\myunit}{\text{m}_y}}
```

Predefined units Most units work as-is with HTML. For the following units, lwarp has already set `\HTMLDeclareSIUnit`: `\celsius`, `\arcminute`, `\arcsecond`, `\elementarycharge`, `\clight`, `\bohr`, `\electronmass`, `\hartree`, `\planckbar`.

⚠ MathJax

Document modifications required for MathJax

⚠ `\sisetup`
- Place `\sisetup` in the preamble before `\begin{document}`. Changes made later may be ignored, especially with MathJax. The MathJax emulation also ignores most macro options.

⚠ complex numbers
- Complex numbers are displayed as entered, ignoring `output-complex-root`.

custom units
- Custom units may be added with `\CustomizeMathJax`. For example, from lwarp-common-mathjax-siunitx:

```
\CustomizeMathJax{\newcommand{\hartree}{\mathit{E}_{\mathrm{h}}}}
\CustomizeMathJax{\newcommand{\angstrom}{\mathrm{\unicode{x212B}}}}
```

⚠ unit spacing
- Units work better using ~ between units instead of using periods.

⚠ \square, \cubic

- To square or cube compound units, enclose the following compound units in braces:

  ```
  \cubic{\centi\meter}
  ```

  Single units do not require braces.

- For \numlist, the argument is printed as text as-is, so use space between semicolons for improved readability.

⚠ Missing $ inserted

- If using parse-numbers = false, also use \num or \qty. siunitx=siunitx>Missing $ inserted.

Also see MathJax option, section 8.7.4.

for HTML output:

```
\RequirePackage{xcolor}% for \convertcolorspec

\LWR@ProvidesPackagePass{siunitx}[=v2]% 2021-04-17

\AtBeginDocument{% in case textcomp was not loaded
    \DeclareSIUnit\bohr{\textit{a}\textsubscript{0}}
    \DeclareSIUnit\clight{\textit{c}\textsubscript{0}}
    \DeclareSIUnit\elementarycharge{\textit{e}}
    \DeclareSIUnit\electronmass{\textit{m}\textsubscript{e}}
    \DeclareSIUnit\hartree{\textit{E}\textsubscript{h}}
    \DeclareSIUnit\planckbar{\LWR@siunitx@textplanckbar}
}% AtBeginDocument
```

Support the S and s column types:

```
\AtBeginDocument{
\HTMLnewcolumntype{S}[1][]{>{\begingroup\sisetup{#1}}c<{\endgroup}}
\HTMLnewcolumntype{s}[1][]{>{\begingroup\sisetup{#1}}c<{\endgroup}}
}
```

\@ensuredmath is not supported inside an \hbox, so it must temporarily be restored to its original. Similar for \mbox. SVG math is created explicitly when necessary, using \LWR@subsingledollar.

```

Modified to use the print version of \@ensuredmath to avoid having a lateximage each time.

Passing `range-phrase` to common-mathjax-siunitx does not seem to work with v2 using translator as it does with v3 using translations. The `range-phrase` therefore is set to an en-dash.

common-mathjax-siunitx

(*Emulates or patches code by* Joseph Wright.)

Pkg `common-mathjax-siunitx`

common-mathjax-siunitx adds MathJax for siunitx and siunitx-v2.

for HTML output: MathJax

For MathJax.

The following runs much faster as separate `\CusomizeMathJax` calls instead of one single call.

```
\begin{warpMathJax}
\LWR@infoprocessingmathjax{siunitx}

\CustomizeMathJax{\newcommand{\tothe}[1]{^{#1}}}
\CustomizeMathJax{\newcommand{\raiseto}[2]{{#2}^{#1}}}
```

Used as an end marker when parsing values:

```
\CustomizeMathJax{\newcommand{\LWRsiunitxEND}{}}
```

\ang [⟨*options*⟩] {⟨*value*⟩}

```
\CustomizeMathJax{\def\LWRsiunitxang#1;#2;#3;#4\LWRsiunitxEND{%
    \ifblank{#1}{}{\num{#1}\degree}%
    \ifblank{#2}{}{\num{#2}^{\unicode{x2032}}}% \prime
    \ifblank{#3}{}{\num{#3}^{\unicode{x2033}}}% \dblprime
}}
\CustomizeMathJax{\newcommand{\ang}[2][]{\LWRsiunitxang#2;;;\LWRsiunitxEND}}
```

\num [⟨*options*⟩] {⟨*value*⟩}

`\num` handles optional powers (`e`, `E`, `d`, `D`), multiples (`x`), plus and minus, and period or comma decimal output.

To split the string, `\def` is used with parameter delimiters. When each of the following macros is used, extra delimiters are padded to the end of the arguments of each macro when used, and the final argument of each collects any extra unused delimiters.

The number is split by dimensions (`x`), then by powers (`E`, `e`, `D`, `d`), then by plus / minus (`+-`, `\pm`), then by plus and minus (`+`, `-`), then into pieces before and after the decimal point or decimal comma.

Determine if the number is output with a decimal period or a decimal comma. The enclosing braces tell MathJax to not add extra space after the punctuation.

```
\ExplSyntaxOn
\AtBeginDocument{
\ifdefstring{\l__siunitx_output_decimal_tl}{{,}}

    {\CustomizeMathJax{\def\LWRsiunitxdecimal{.}}}
}
\ExplSyntaxOff

Any units which must be distributed across multiple dimensions:

```
\CustomizeMathJax{\def\LWRsiunitxdistribunit{}}
```

siunitx accepts either commas or periods as decimal points. `\LWRsiunitxprintdecimal` splits its input by periods then commas, parsing out before and after sections to print on either side of the decimal point.

`\LWRsiunitxENDTWO` is used only by `\LWRsiunitxprintdecimalsubtwo`, to avoid a parsing conflict with the more widely-used `\LWRsiunitxEND`.

The following splits by decimal commas:

```
            \mathrm{#2}%
        }%

§ 564 Package

skmath

(*Emulates or patches code by* Simon Sigurdhsson.)

Pkg skmath

skmath is used as-is for SVG math, and is emulated for MathJax.

for HTML output:

```
\LWR@ProvidesPackagePass{skmath}[2019/10/15]
```

Only defined if package option requested:

```
\begin{warpMathJax}
\ExplSyntaxOn
\bool_if:NT\g__skmath_define_common_sets_bool{
\CustomizeMathJax{\newcommand{\N}{\mathbb{N}}}
\CustomizeMathJax{\newcommand{\Z}{\mathbb{Z}}}
\CustomizeMathJax{\newcommand{\Q}{\mathbb{Q}}}
\CustomizeMathJax{\newcommand{\R}{\mathbb{R}}}
\CustomizeMathJax{\newcommand{\C}{\mathbb{C}}}
}
```

skmath is using l3keys, which does not seem to have an equivalent to `\@ifpackagewith`. To detect package options, comparisons with the following are made to see if various macros have been defined as follows:

```
\cs_gset_nopar:Npn\LWR__skmath_imaginary_unit:n#1{{#1}}
\cs_gset_nopar:Npn\LWR__skmath_natural_log_e:{{e}}
\cs_gset_nopar:Npn\LWR__skmath_integral_d:{{d}}
\cs_gset_nopar:Npn\LWR__skmath_total_derivative_d:{{d}}
```

If `notation=iso`, use upright, else italic:

```
\cs_if_eq:NNTF \__skmath_imaginary_unit:n \LWR__skmath_imaginary_unit:n
    {
        \CustomizeMathJax{\newcommand{ii}{\mathit{i}}}
        \CustomizeMathJax{\newcommand{jj}{\mathit{j}}}
    }
    {
        \CustomizeMathJax{\newcommand{ii}{\mathrm{i}}}
        \CustomizeMathJax{\newcommand{jj}{\mathrm{j}}}
    }
```

If `notation=iso`, use upright, else italic:

```
\cs_if_eq:NNTF \__skmath_natural_log_e: \LWR__skmath_natural_log_e:
    { \CustomizeMathJax{\newcommand{\ee}{\mathit{e}}} }
    { \CustomizeMathJax{\newcommand{\ee}{\mathrm{e}}} }
```

skmath uses `\DeclarePairedDelimiter` from mathtools for `\abs` and `\norm`, and lwarp uses this to automatically define MathJax definitions for each.

If `notation=english`, use slanted, else upright:

```
\cs_if_eq:NNTF \__skmath_integral_d: \LWR__skmath_integral_d:
    { \CustomizeMathJax{\newcommand{\d}{\mathit{d}}} }
    { \CustomizeMathJax{\newcommand{\d}{\mathrm{d}}} }
```

Used to parse comma and caret arguments for \pd and \td:

```
\CustomizeMathJax{\def\LWRskmathEND{}}
```

Parse the arguments with up to four commas. Argument 6 contains any leftover commas.

```
\CustomizeMathJax{\def\LWRskmathpdstarsub#1#2,#3,#4,#5,#6\LWRskmathEND{
    #1_{#2#3#4#5}%
}}

\CustomizeMathJax{\newcommand{\LWRskmathpdstar}[2]{%
    \LWRskmathpdstarsub{#1}#2,,,,\LWRskmathEND%
}}
```

Parse the arguments with up to two carets. Argument 3 contains any leftover carets. \LWRskmathpdplus is used to only place a plus sign starting after the first term. \LWRskmathpdone is used to only place a 1 digit if a second or later term does not have a power.

```
\CustomizeMathJax{\def\LWRskmathpdnumerator#1^#2^#3\LWRskmathEND{%
    \ifblank{#1}{}{
        \ifblank{#2}{\LWRskmathpdplus\LWRskmathpdone}{\LWRskmathpdplus#2}
    }
}}
```

Parse the arguments with up to two carets. Argument 3 contains any leftover carets.

```
\CustomizeMathJax{\def\LWRskmathpddenominator#1^#2^#3\LWRskmathEND{%
    \ifblank{#1}{}{%
        \ifblank{#2}%
            {\partial{#1}}%
            {\partial{#1}^{#2}}%
    }%
}}
```

Factored from \LWRskmathpdnostarsub, following:

The phrase ^{} appears to be required while parsing the carets. \LWRskmathpdplus is used to only place a plus sign starting after the first term. \LWRskmathpdone is used to only place a 1 digit if a second or later term does not have a power.

This may not be recursion-safe. (Is there really such as a thing as nested differentials?)

```

\CustomizeMathJax{\newcommand{\LWRskmathexpparens}[1]{%

```
\CustomizeMathJax{\newcommand{\LWRskmathexpnostar}[1]{%

If the latexmk option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

⚠ \thepage

When using \AtWriteToIndex or \AtNextWriteToIndex, the user must not refer to \thepage during HTML output, as the concept of a page number is meaningless. Instead, do

```
\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the \index-like action occurs, and then refer to \arabic{LWR@autoindex} instead of \thepage where the reference should occur.

See section 692.17 in the lwarp-patch-memoir package for the \@@wrspindexhyp macro as an example.

for HTML output:

```
\LWR@ProvidesPackagePass{splitidx}[2016/02/18]

\catcode`\_=12%
\xpatchcmd{\newindex}
    {\jobname-#2.idx}
    {\jobname-#2_html.idx}
    {}
    {\LWR@patcherror{splitidx}{@newindex}}
\catcode`\_=8%
```

Patched to use lwarp's automatic indexing counter instead of \thepage:

```
\renewcommand*{\@wrsindex}[2][]{%
  \ifx\relax#1\relax
    \if@splitidx
      \@wrsindex[idx]{#2}%
```

```
    \else

%     \else
%       \def\@tempb{\@@wrsindex{#1}}%
%       \expandafter\@tempb\@tempa||\\%

```

The label is assigned after the file write to avoid conflict with cleveref.

```
    \label{LWRindex-\arabic{LWR@autoindex}}%    lwarp
    \endgroup
    \@esphack

File 466 **lwarp-stackengine.sty**

§ 575 Package stackengine

(*Emulates or patches code by* Steven B. Segletes.)

Pkg stackengine

stackengine is patched for use by lwarp.

for HTML output:

```
\LWR@ProvidesPackagePass{stackengine}[2017/02/13]
```

The original version is neccessary for the patched \@stack and \stackanchor, where nesting lateximages does not work:

```
\LetLtxMacro\LWR@orig@stackengine\stackengine

\renewcommand*{\stackengine}[8]{%
    \ifstrequal{#4}{O}%
        {\begin{lateximage}[\ImageAltText]}%
        {\begin{lateximage}[\ImageAltText][][vertical-align:top]}%
    \LWR@orig@stackengine{#1}{#2}{#3}{#4}{#5}{#6}{#7}{#8}%
    \end{lateximage}%
}
```

\@stack uses a lateximage with a vertical alignment:

```
\LetLtxMacro\LWR@orig@@stack\@stack

\xpatchcmd{\LWR@orig@@stack}{\stackengine}{\LWR@orig@stackengine}
    {}
    {\LWR@patcherror{stackengine}{LWR@orig@@stack}}

\renewcommand*{\@stack}[4]{%
    \ifstrequal{#3}{O}%
        {\begin{lateximage}[\ImageAltText]}%
        {\begin{lateximage}[\ImageAltText][][vertical-align:top]}%
    \LWR@orig@@stack{#1}{#2}{#3}{#4}%
    \end{lateximage}%
}
```

The lapping macros are disabled for HTML:

```
\newcommand*\LWR@HTML@@stacklap[4]{#3}
\LWR@formatted{@stacklap}
```

\stackanchor is patched for two instances of \stackengine. A lateximage with vertical alignment is used.

```
\xpatchcmd{\stackanchor}{\stackengine}{\LWR@orig@stackengine}
    {}
    {\LWR@patcherror{stackengine}{stackanchor patch 1}}

\xpatchcmd{\stackanchor}{\stackengine}{\LWR@orig@stackengine}
    {}
    {\LWR@patcherror{stackengine}{stackanchor patch 2}}

\xpretocmd{\stackanchor}
    {\begin{lateximage}[\ImageAltText][][vertical-align:middle]}
    {}
    {\LWR@patcherror{stackengine}{stackanchor pre}}

\xapptocmd{\stackanchor}{\end{lateximage}}
    {}
    {\LWR@patcherror{stackengine}{stackanchor app}}
```

\Centerstack is simply placed inside a lateximage with a vertical alignment:

```
\xpretocmd{\Centerstack}
    {\begin{lateximage}[\ImageAltText][][vertical-align:middle]}
    {}
    {\LWR@patcherror{stackengine}{Centerstack pre}}

\xapptocmd{\Centerstack}{\end{lateximage}}
    {}
    {\LWR@patcherror{stackengine}{Centerstack app}}
```

\savestack reverts to print mode while saving the box, then places it inside a lateximage when used:

```
\renewcommand*\savestack[2]{%
  \xdef\sv@name{\stack@macro@name{#1}}%
  \@ifundefined{\sv@name content}{%
    \expandafter\newsavebox\expandafter{\csname\sv@name content\endcsname}%
   }{}%
    \begingroup%    lwarp
    \LWR@restoreorigformatting%     lwarp
   \RenewDocumentEnvironment{lateximage}{s o s o o d()}{}{}% lwarp: inside group
  \expandafter\LWR@gsavebox\csname\sv@name content\endcsname{#2}%
  \expandafter\gdef\expandafter#1\expandafter{%
        \expandafter\begin\expandafter{lateximage\expandafter}%     lwarp
        \expandafter\usebox\expandafter%
        {\csname\sv@name content\endcsname}%
        \expandafter\end\expandafter{lateximage\expandafter}%       lwarp
    }%

⚠ As of this version, option autobold does not appear to work for PDF output.

⚠ For MathJax, the tilde character ~ does not create \sim. Use \sim directly.

⚠ Because MathJax has limited conditional processing:

- \wrap only creates square braces, no matter what its optional arguments.
- \P, \pCau, \pN, and \pU do not handle special cases.

⚠ \and To have \and work if using \maketitle, place the following after the start of the document:

```
\newcommand*{\and}{%
    \relax\ifmmode%
        \expandafter\;\mb{\mathrm{and}}\;%

§ 578 Package statistics

(*Emulates or patches code by* Julien Rivaud.)

Pkg statistics

statistics is patched for use by lwarp.

⚠ \color

The statistics documentation examples include the use of the \color macro. Use \textcolor instead.

⚠ math

The statistics package uses math arrays, but the HTML version uses text tabulars to allow text copy/paste. If math is required, use \ensuremath or \(and \) as needed.

Pre/postline is ignored, and \hline is used instead. Each table will have an \hline above and below as a frame.

for HTML output:

```
\LWR@ProvidesPackagePass{statistics}[2019/09/29]
\ExplSyntaxOn
```

To use text tabular instead of math array. This allows text copy/paste of the results.

In the following, all changes for the Lwarp package are labelled "lwarp".

Redefined using the lwarp version of &:

```

With lwarp, `\ensuremath` creates an SVG image, but its `alt` tag does not contain the text of the contents for copy/paste, since these expressions are usually not simple text. For the statistics package, copy/paste is restored by using text instead of math output.

For the leftmost column. Redefined to use text output:

```
\cs_set_protected_nopar:Nn \__statistics_table_start: {
    \int_zero:N \l__statistics_nbvals_int
    \clist_pop:NNT \l__statistics_table_maxcols_clist \l_tmpa_tl {

    }
   \clist_map_inline:nn { values, counts, frequencies, icc, icf, dcc, dcf } {
        \tl_set:cx { l__statistics_table_##1_tl } {
%             \exp_not:N \ensuremath {
                \exp_not:N \hbox {
                    \exp_not:c { l__statistics_table_##1_name_tl }
                }
%             }
        }
    }
}
```

For the first row. Redefined to use text output:

```
\RenewDocumentCommand \__statistics_IN:w { m u{;} u{;} m } {
%     \ensuremath{ \left#1 \num{#2} \mathbin{;} \num{#3} \right#4 }
    #1 #2 ; #3 #4%      lwarp
}

\__statistics_setup:nn { table } {
%     values/format = \ensuremath{#1},
    values/format = {#1},%      lwarp
}
```

Added `\ExplSyntaxOn/Off` to avoid errors. (In once instance, a double subscript error appeared.)

At present, the package options for lofdepth and lotdepth are not working. These counters must be set separately after the package has been loaded.

⚠ horizontal spacing

In the document source, use \hfill and \hspace* between subfigures to spread them apart horizontally. The use of other forms of whitespace may cause paragraph tags to be generated, resulting in subfigures appearing on the following lines instead of all on a single line.

for HTML output:

Accept all options for lwarp-subfig:

§ 600 Package

tensor

(*Emulates or patches code by* Philip G. Ratcliffe.)

Pkg tensor

tensor is used as-is for SVG math, and is emulated for MathJax.

⚠ spacing

Compressed spacing and left justification are not possible with MathJax.

for HTML output:

```
\LWR@ProvidesPackagePass{tensor}[2004/12/20]
```

For MathJax. Special handling is required to parse the superscript and subscript arguments.

When a superscript or subscript is seen, it is processed and then the remainder is processesed recursively.

```

File 505 **`lwarp-threeparttablex.sty`**

§ 614 Package

threeparttablex

Pkg `threeparttablex`

threeparttablex is patched for use by lwarp.

threeparttablex is used with longtable and booktabs as follows:

```
\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead   % or \endhead, for print and HTML
\warpprintonly{          % not used in HTML
  [ . . . ] \endhead     % or \endfirsthead
  [ . . . ] \endfoot
  \bottomrule \insertTableNotes \endlastfoot
}
. . .  table contents . . .
\warpHTMLonly{   % HTML last footer
  \bottomrule
  \UseMinipageWidths     % optional
  \insertTableNotes
  \endlastfoot
}
\end{longtable}
```

table width

The table notes are created using a `\multicolumn`. By default the width is not specified to the browser, so long table notes can cause the table to be spread out horizontally. For HTML output, lwarp guesses the width of the table depending on the number of columns, then restricts its guess to a min/max range. To use this guess for the width of the table notes, use `\UseMinipageWidths` before `\insertTableNotes`. The width is then specified, and in many cases the result is an improvement in overall table layout.

for HTML output:

```
\LWR@ProvidesPackagePass{threeparttablex}[2013/07/23]
```

The width is guessed depending on the number of columns, then limited to a min/max.

catcodes

lwarp changes the catcode of `$` for its own use. The Ti*k*z `babel` library temporarily changes catcodes back to normal for Ti*k*z's use. tikz v3.0.0 introduced the `babel` library which handles catcode changes. For older versions, lwarp must change `$`'s catcode itself.

Also see:
https://tex.stackexchange.com/questions/16199/test-if-a-package-or-package-option-is-loaded

```
\newbool{LWR@tikzbabel}

\IfPackageAtLeastTF{tikz}{2013/12/20}% Test for Tikz version v3.0.0
{\usetikzlibrary{babel}\booltrue{LWR@tikzbabel}}
{\boolfalse{LWR@tikzbabel}}
```

Env pgfpicture

The `\pgfpicture` environment is enclosed inside a `\lateximage`. Enclose the low-level `\pgfpicture` in a `lateximage`. This is also used by the higher-level `\tikz` and `tikzpicture`.

```
\preto\pgfpicture{%
    \begin{lateximage}[-tikz-~\PackageDiagramAltText]%
    \ifbool{LWR@tikzbabel}% Test for Tikz version v3.0.0
    {}%
    {\catcode`\$=3}% dollar sign is math shift
}

\appto\endpgfpicture{\end{lateximage}}
```

Ti*k*z is placed inside an SVG image, so use the original meanings of the following:

§ 636.1 Combining `\newfloat`, `\trivfloat`, and algorithmicx

For both print and HTML output:

⚠ When using float, trivfloat, or algorithmicx at the same time, be aware of conflicting file usage. algorithmicx uses `.loa`. trivfloat by default starts with `.loa` and goes up for additional floats, skipping `.lof` and `.lot`.

⚠ When using `\newfloat`, be sure to manually assign higher letters to the `\newfloat` files to avoid `.loa` used by algorithmicx, and any files used by trivfloat. Also avoid using `.lof` and `.lot`.

⚠ When using `\trivfloat`, you may force it to avoid conflicting with algorithmicx by starting trivfloat's file extensions with `.lob`:

```
\makeatletter
\setcounter{tfl@float@cnt}{1} % start trivfloats with .lob
\makeatletter

File 538 **lwarp-unicode-math.sty**

§ 647 Package

unicode-math

(*Emulates or patches code by* Will Robertson.)

Pkg unicode-math

unicode-math is supported as-is for HTML with SVGmath.

⚠ MathJax

If the document source includes embedded Unicode characters, these may not be reproduced correctly for *pdftotext*, and thus not display correctly in MathJax.

Symbol font commands are emulated, but not all combinations are supported by MathJax, especially with the dedicated Greek macros. Symbol macros such as `\symbfsf` may not be sans or bold. For Greek, use the Unicode equivalent, if necessary.

⚠ `\mathversion`

The MathJax emulation does not change with the use of `\mathversion`. Whatever emulation is established at the begin of the document will remain.

The option `sans-style` honors `upright` and `italic`, but `italic` will not be sans, in order to support Greek macros.

Greek macros such as `\alpha` respond to the `math-style` option. Latin symbols does not, per MathJax limitations, unless placed inside `\symbit` or similar.

Macros from the categories `\mathopen`, `\mathclose`, and `\mathfence` are emulated. Due to current MathJax limitations, not all stretch to the correct height.

Also emulated are macros from the categories `\mathpunct`, `\mathover`, `\mathunder`, `\mathaccent`, `\mathbotaccent`, and `\mathop`.

The individual unicode-math macros of categories `\mathbin`, `\mathord`, and `\mathrel` are not emulated for MathJax, as there are more than two thousand of them, but they may be added as needed. Place the following in the document preamble after loading unicode-math, including a definition for each macro which is used in the document but undefined in MathJax:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\uplus}{\mathbin{\unicode{x0228E}}}}
...
\end{warpMathJax}
```

Use `\mathrel`, `\mathbin`, etc. depending on the category of each macro. For a list of macro names and symbols, see **texdoc unimath-symbols**.

Pkg units

units is patched for use by lwarp.

Values are not styled by CSS, and take the style of the surrounding HTML text.

Units are styled according to the print version, so they will be forced to upright roman in HTML if the print version does so. It may be necessary to adjust the document's body CSS to match the print version.

\attrib

The documentation for the verse and memoir packages suggest defining an \attrib command, which may already exist in current documents, but it will only work for print output. lwarp provides \attribution, which works for both print and HTML output. To combine the two so that \attrib is used for print and \attribution is used for HTML:

```
\begin{warpHTML}
\let\attrib\attribution
\end{warpHTML}
```

Len \vleftskip
Len \vleftmargini
Len \HTMLvleftskip
Len \HTMLleftmargini

These lengths are used by verse and memoir to control the left margin, and they may already be set by the user for print output. New lengths \HTMLvleftskip and \HTMLleftmargini are provided to control the margins in HTML output. These new lengths may be set by the user before any verse environment, and persist until they are manually changed again. One reason to change \HTMLleftmargini is if there is a wide \flagverse in use, such as the word "Chorus", in which case the value of \HTMLleftmargini should be set to a wide enough length to contain "Chorus". The default is wide enough for a stanza number.

⚠ spacing

Horizontal spacing relies on *pdftotext*'s ability to discern the layout (-layout option) of the text in the HTML-tagged PDF output. For some settings of \HTMLleftmargini or \HTMLleftskip the horizontal alignment may not work out exactly, in which case a label may be shifted by one space. During translation to HTML, the stanza numbers are kept out of the left margin, which would have caused *pdftotext* to shift everything over.

⚠ verse margin

Env verse

The verse environment will be placed inside a HTML <pre>.

```
\AfterEndPreamble{
\LWR@traceinfo{Patching verse.}
```

At the beginning of the verse environment:

```
\AtBeginEnvironment{verse}
{%
```

Use the original list environment inside a <pre> to attempt to preserve formatting.

```
\LWR@restoreoriglists%
```

Pkg verse
Cls memoir
\flagverse
Len \vleftskip

The verse or memoir packages can place stanza numbers to the left with their \flagverse command. The following does not allow them to go into the left margin, which would cause *pdfcrop* to crop the entire page further to the left.

```
\ifdef{\vleftskip}{%
\setlength{\vleftskip}{\HTMLvleftskip}
\setlength{\leftmargini}{\HTMLleftmargini}
}{}
\LWR@forcenewpage
\LWR@atbeginverbatim{verse}%
}
```

After the end of the verse environment, which places the <pre> tag at the regular left margin:

```
\AtEndEnvironment{verse}{%
\leavevmode%
\LWR@afterendverbatim%
}
```

Patch to place poemtitle inside an HTML of class poemtitle:

```
\ifdef{\poemtitle}{
\DeclareDocumentCommand{\@vstypeptitle}{m}{%
    \vspace{\beforepoemtitleskip}%
```

```
  {\InlineClass{poemtitle}{\poemtitlefont #1}\par}%
  \vspace{\afterpoemtitleskip}%
 }
}{}

\LWR@traceinfo{Finished patching verse.}
}% AfterEndPreamble

vwcol

(*Emulates or patches code by* Will Robertson.)

Pkg vwcol

vwcol is patched for use with lwarp.

The `width` option is ignored. All `vwcol` environments adjust to 1–3 equal-width columns, depening on the width of the browser window.

The remaining options are supported, except for `lines` and `maxrecursion`.

for HTML output:

```

Factored from `\vwcol`. Each is given a style tag to append to the final style.

`\LWR@vwcol@addrule` {⟨*style tag*⟩}

```
\newcommand*{\LWR@vwcol@addrule}[1]{%

}
```

Env vwcol {⟨*key/values*⟩}

Redefine the environment to add a HTML style. The style is built depending on the required options.

```
\renewenvironment*{vwcol}[1][]{%
```

New paragraph, and process the options:

```
\LWR@stoppars%
\vwcolsetup{#1}%
```

Begin with no style:

```
\newcommand*{\LWR@vwcolstyle}{}
```

presep and postsep are created with HTML margins:

```
\if@vwcol@presep
    \appto{\LWR@vwcolstyle}{margin-left: 1em ; padding-left: .5em ; }
\fi
\if@vwcol@postsep
    \appto{\LWR@vwcolstyle}{margin-right: 1em ; padding-right: .5em ; }
\fi
```

sep becomes column-gap:

```
\ifdimgreater{\vwcol@sep}{1sp}{
    \LWR@vwcol@addgap{column-gap}
    \LWR@vwcol@addgap{-moz-column-gap}
    \LWR@vwcol@addgap{-webkit-column-gap}
}{}
```

rule become column-rule, while prerule and postrule become HTML borders:

```
\convertcolorspec{named}{\vwcol@rulecol}{HTML}\LWR@vwcol@rulecolor%
\ifdimgreater{\vwcol@rule}{0pt}{
    \ifdimless{\vwcol@rule}{1pt}{
        \setlength{\vwcol@rule}{1pt}

    \if@vwcol@prerule\LWR@vwcol@addrule{border-left}\fi
    \if@vwcol@postrule\LWR@vwcol@addrule{border-right}\fi
}{}
```

Each of the justify options becomes a text-align. Indentation is added where appropriate.

```
\ifdefequal{\vwcol@justify}{\RaggedRight}{
    \appto{\LWR@vwcolstyle}{text-align: left ; }
    \ifdimgreater{\vwcol@parindent}{0pt}{
        \appto{\LWR@vwcolstyle}{%

§ 671 Package xcolor

(*Emulates or patches code by* Dr. Uwe Kern.)

Pkg xcolor

xcolor is supported by lwarp.

§ 671.1 Limitations

\colorboxBlock and \fcolorboxBlock

\colorboxBlock and \fcolorboxBlock are provided for increased HTML compatibility, and they are identical to \colorbox and \fcolorbox in print mode. In HTML mode they place their contents into a instead of a . These s are set to display: inline-block so adjacent \colorboxBlocks appear side-by-side in HTML, although text is placed before or after each.

Print-mode definitions for \colorboxBlock and \fcolorboxBlock are created by lwarp's core if xcolor is loaded.

background: none

\fcolorbox and \fcolorboxBlock allow a background color of none, in which case only the frame is drawn, which can be useful for HTML.

color support

Color definitions, models, and mixing are fully supported without any changes required.

colored tables

\rowcolors is supported, except that the optional argument is ignored so far.

colored text and boxes

\textcolor, \colorbox, and \fcolorbox are supported.

\color and \pagecolor

\color and \pagecolor are ignored. Use css or \textcolor where possible.

§ 671.2 xcolor definitions: location and timing

The lwarp core and its lwarp-xcolor package are tightly integrated to allow comparable results for print, HTML, and print inside an HTML `lateximage`. This requires a number of definitions and redefintions depending on whether each of xcolor and `lateximage` is being used, and whether print or HTML is being generated. Some of these actions are one-time when xcolor is loaded, and others are temporary as `lateximage` is used.

When xcolor is loaded in print mode: No special actions are taken at the time that xcolor is loaded in print mode, but see `\AtBeginDocument` below.

When lwarp-xcolor is loaded in HTML mode: xcolor's original definitions are saved for later restoration. `\LWR@restoreorigformatting` is appended to restore these definitions for use inside a `lateximage`. New HTML-mode definitions are created for `\textcolor`, `\pagecolor`, `\nopagecolor`, `\colorbox`, `\colorboxBlock`, `\fcolorbox`, `\fcolorboxBlock`, and `fcolorminipage`.

`\AtBeginDocument` in print or HTML mode: See Section 89. If xcolor has been loaded, the print-mode `\fcolorbox` is modified to accept a background color of none, and additional definitions are created for lwarp's new macros print-mode macros `\colorboxBlock`, `\fcolorboxBlock`, and `fcolorminipage`. The HTML versions of these macros will already have been created by lwarp-xcolor if it has been loaded.

For use inside an HTML `lateximage`, `\LWR@restoreorigformatting` is appended to temporarily set these functions to their print-mode versions.

In a `lateximage` in HTML mode: `\LWR@restoreorigformatting` temporarily restores the print-mode definitions of xcolor's functions. See `\LWR@restoreorigformatting` on page 528.

`\color`:

Print: Used as-is.

HTML: Ignored by *pdftotext*, and will not appear.

HTML `lateximage`: Colors will appear in a `lateximage`.

`\textcolor`:

Print: Used as-is.

HTML: Redefined by lwarp-xcolor, page 1220.

HTML `lateximage`: Remembers and reuses the print version.

`\pagecolor`:

Print: Used as-is.

HTML: Ignored.

HTML `lateximage`: Colors will be picked up in a `lateximage`.

`\nopagecolor`:

Print: Used as-is.

HTML: Ignored.

HTML `lateximage`: Colors will be picked up in a `lateximage`.

\colorbox:

Print: Used as-is.

HTML: Redefined by lwarp-xcolor, page 1220.

HTML lateximage: Remembers and reuses the print version.

\colorboxBlock:

Print: Becomes \colorbox.

HTML: Newly defined by lwarp-xcolor to use a , page 1220.

HTML lateximage: Remembers and reuses the print version \colorbox.

\fcolorbox:

Print: Modified to allow a background of none.
\LWR@print@fcolorbox at section 89

HTML: Redefined by lwarp-xcolor, page 1221.

HTML lateximage: Remembers and reuses the print version.

\fcolorboxBlock:

Print: Becomes \fcolorbox. Section 89

HTML: Newly defined by lwarp-xcolor to use a , page 1221.

HTML lateximage: Remembers and reuses the print version \fcolorbox.

fcolorminipage:

Print: Newly defined in the lwarp core.
LWR@print@fcolorminipage at section 89

HTML: Newly defined by lwarp-xcolor, page 1222.

HTML lateximage: Uses the print version.

\boxframe:

Print: Used as-is.

HTML: Redefined by lwarp-xcolor, page 1223.

HTML lateximage: Remembers and reuses the print version.

```

§ 671.4 Remembering and restoring original definitions

Remember the following print-mode actions to be restored when inside a `lateximage` environment:

```
\LetLtxMacro\LWR@print@pagecolor\pagecolor
\LetLtxMacro\LWR@print@nopagecolor\nopagecolor
```

`\LWR@restoreorigformatting` Inside a `lateximage` the following gets restored to their print-mode actions:

```
\appto\LWR@restoreorigformatting{%
    \LetLtxMacro\pagecolor\LWR@print@pagecolor%
    \LetLtxMacro\nopagecolor\LWR@print@nopagecolor%
}
```

§ 671.5 `\normalcolor`

`\normalcolor`

```
\DeclareRobustCommand{\LWR@HTML@normalcolor}{\color{black}}%

\LWR@formatted{normalcolor}
```

§ 671.6 HTML color style

`\LWR@findcurrenttextcolor` Sets `\LWR@tempcolor` to the current color.

```
\renewcommand*{\LWR@findcurrenttextcolor}{%
    \LWR@traceinfo{LWR@findcurrenttextcolor}%
    \protect\colorlet{LWR@current@color}{.}%
    \LWR@traceinfo{LWR@findcurrenttextcolor B}%
   \protect\convertcolorspec{named}{LWR@current@color}{HTML}\LWR@tempcolor\relax%
    \LWR@traceinfo{LWR@findcurrenttextcolor: done}%
}
```

`\LWR@currenttextcolorstyle` Prints a color style for the current color.

```
\newcommand*{\LWR@currenttextcolorstyle}{%
    \LWR@findcurrenttextcolor%
    \ifdefstring{\LWR@tempcolor}{000000}%
    {}%
    {color: \LWR@origpound\LWR@tempcolor ; }%
}
```

`\LWR@textcurrentcolor` {⟨*text*⟩} Like `\textcolor` but uses the current `\color` instead.

```
\DeclareDocumentCommand{\LWR@textcurrentcolor}{m}{%

Print the converted color:

```
    \LWR@origpound\LWR@tempcolor%
    \endgroup%
}
```

`\LWR@backgroundcolor` [⟨*model*⟩] {⟨*color*⟩} {⟨*text*⟩}

Similar to `\textcolor`, but prints black text against a color background.

Converted into an HTML hex color span.

```

§ 671.7 HTML border

`\LWR@borderpadding` {⟨*colorstyle*⟩} {⟨*color*⟩} Prints the HTML attributes for a color border and padding. `\LWR@forceminwidth` must be used first in order to set the border width.

```
\newcommand*{\LWR@borderpadding}[2]{%

⚠ font size In the user's document preamble, lwarp should be loaded after font-related setup. During HTML conversion, this font is used by lwarp to generate its initial PDF output containing HTML tags, later to be converted by *pdftotext* to a plain text file. While the text may be in any font which *pdftotext* can read, the math is directly converted into SVG images using this same user-selected font. `xfrac` below is set for the Latin Modern (lmr) font. If another font is used, it may be desirable to redefine `\xfracHTMLfontsize` with a different em size.

`\sfrac` `[`⟨*instance*⟩`]` `{`⟨*num*⟩`}` `[`⟨*sep*⟩`]` `{`⟨*denom*⟩`}`

A text-mode instance for the default font is provided below. The numerator and denominator formats are adjusted to encase everything in HTML tags. `\scalebox` is made null inside the numerator and denominator, since the HTML tags should not be scaled, and we do not want to introduce additional HTML tags for scaling.

In math mode, which will appear inside a `latexi`mage, no adjustments are necessary.

`\xfracHTMLfontsize` User-redefinable macro which controls the font size of the fraction.

```
\newcommand*{\xfracHTMLfontsize}{.6em}
```

instances Instances of xfrac for various font choices:

Produce css for a small raised numerator and a small denominator.

Scaling is turned off so that *pdftotext* correctly reads the result.

File 583 **lwarp-patch-memoir.sty**

§ 692 Package

patch-memoir

(*Emulates or patches code by* Peter Wilson.)

Pkg lwarp-patch-memoir Patches for memoir class.

⚠ Not fully tested! Please send bug reports!

lwarp loads this package when the memoir class is detected.

⚠ captions — lwarp uses caption, which causes a warning from memoir. This is normal. Adjust captions via caption, instead of memoir.

⚠ options clash — While emulating memoir, lwarp pre-loads a number of packages (section 692.1). This can cause an options clash when the user's document later loads the same packages with options. To fix this problem, specify the options before loading lwarp:

```
\documentclass{memoir}
. . .
\PassOptionsToPackage{options_list}{package_name}
. . .
\usepackage{lwarp}
. . .
\usepackage{package_name}
```

⚠ version numbers — memoir emulates a number of packages, and declares a version date for each which often does not match the date of the corresponding freestanding package. This can cause warnings about incorrect version numbers. Since lwarp is intended to support the freestanding packages, which are often newer than the date declared by memoir, it is hoped that memoir will update and change its emulated version numbers to match.

`\label(bookmark){tag}` — `\label` accepts an optional `(bookmark)` argument, but this is ignored in HTML.

⚠ `comment` — The `comment` environment is from the comment package, and thus requires that the `\begin` and `\end` each be on its own line:

```
\begin{comment}

`\newcomment` — Comments defined with `\newcomment` use memoir's defintions, and behave as expected, where the `\begin` and `\end` do have to each be on its own line.

⚠ verbatim footnotes — `\verbfootnote` is not supported.

⚠ `\newfootnoteseries` — `\newfootnoteseries`, etc. are not supported.

⚠ page notes — lwarp loads pagenote to perform memoir's pagenote functions, but there are minor differences in `\pagenotesubhead` and related macros.

page notes with cleveref — To add support for pagenotes with cleveref, add:

```
\crefname{pagenote}{page note}{page notes}
\Crefname{pagenote}{Page note}{Page notes}
```

page note `\nameref` — Note that for print mode, `\nameref` print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

⚠ poems — Poem numbering is not supported.

⚠ `verbatim` — The `verbatim` environment does not yet support the memoir enhancements. It is currently recommended to load and use fancyvrb instead.

⚠ glossaries — The memoir glossary system is not yet supported by *lwarpmk*. The glossaries pack-

age may be used instead, but does require the glossary entries be changed from the memoir syntax to the glossaries syntax.

for HTML output:

```
\ProvidesPackage{lwarp-patch-memoir}
```

§ 692.1 Packages

These are pre-loaded to provide emulation for many of memoir's functions. memoir pretends that abstract, etc. are already loaded, via its "emulated" package mechanism, but lwarp is directly loading the "lwarp-" version of each, which happens to avoid memoir's emulation system.

§ 692.2 Label handling

Insert the lwarp label mechanism into the memoir package mechanism:

- `\@mem@old@label` is the LaTeX definition of `\label`.
- `\LWR@orig@label` becomes the memoir definition.
- lwarp's `\LWR@new@label` uses `\LWR@orig@label`.
- Want memoir's `\label` to use lwarp's `\label`, which then would use LaTeX's `\label`.
- So:
  - `\@mem@old@label` is set to `\LWR@new@label`.
  - `\LWR@orig@label` is set to `\@mem@old@label`.
- cleveref then encapsulates all the above with `\cref@old@label`.
- For a subcaption, cleveref modifies memoir's `\sf@memsub@label`, but that change is undone by lwarp.

```
\LetLtxMacro\LWR@orig@label\@mem@old@label
\LetLtxMacro\@mem@old@label\LWR@new@label
```

Patches for subfloats to support additional lwarp labels. This is the non-hyperref version from memoir.

```
\AtBeginDocument{
    \renewcommand*{\sf@@memsub@label}[1]{%
        \@bsphack
        \sf@@memsub@label@hook{#1}%
%         \@memoldlabel{#1}%
        \cref@label{#1}%                    lwarp
        \LWR@label@createtag{sub@#1}%           lwarp
        \protected@write\@auxout{}{%
            \string\newlabel{sub@#1}%
            {{\@nameuse{@@thesub\@captype}}%
            {\thepage}}}%
        \LWR@write@lwarplabel{sub@#1}%          lwarp
        \@esphack
    }
}
```

§ 692.3 Page layout

memoir already set the page size to a default, so it must be forced large for lwarp's use, to avoid tag overflows off the page.

§ 692.11 Floats and captions

\@xfloat
\@xdblfloat

Reestablish lwarp's takeover the float handing, which memoir tried to grab:

```
\AtBeginDocument{
\def\@xfloat #1[#2]{%
    \LWR@floatbegin{#1}[#2]
    \normalsize

    \@nameuse{#1adjustment}%
    \LWR@futurenonspacelet\LWR@mynexttoken\LWR@floatalignment%
}
}
```

\newfloat

[⟨*1: within*⟩] {⟨*2: type*⟩} {⟨*3: ext*⟩} {⟨*4: capname*⟩}

```
\RenewDocumentCommand{\newfloat}{o m m m}{%
    \def\LWR@tempone{#4}%
    \def\LWR@temptwo{\@nameuse{#2name}}%
   \ifdefequal{\LWR@tempone}{\LWR@temptwo}{% recursive name, already defined

            {\DeclareFloatingEnvironment[fileext=#3,name={#4}]{#2}}%
    }%
```

newfloat package automatically creates the \listof command for new floats, but float does not, so remove \listof here in case it is manually created later.

```

```

\newlistof [⟨*within*⟩] {⟨*type*⟩} {⟨*ext*⟩} {⟨*listofname*⟩}

Emulated through the \newfloat mechanism. Note that memoir uses a different syntax than tocloft for the name.

\startnoteentrystart

To have cleveref work with page note labels, the following patch writes \thepagenote and also adds \arabic{pagenote} to the first argument written to the .ent file:

```
\startnoteentry{{\thepagenote}{\arabic{pagenote}}} . . .
```

The arabic value is required for cleveref. \thepagenote becomes \@firstoftwo#1 and the arabic value becomes \@secondoftwo#1.

⚠ \nameref Note that for print mode,\nameref print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

§ 693 Package common-multimedia

Pkg lwarp-common-multimedia

Common code for multimedia, movie15, and media9.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

for HTML output:

```

\newlength{\LWR@multimedia@width}
\newlength{\LWR@multimedia@height}
\newlength{\LWR@multimedia@maxdimension}

\LWR@multimedia@printsize

Proportional to \linewidth and the viewport's smaller dimension. This scales each object such that it will always fit on the screen, even if a tall or wide object inside a tall or wide viewport.

(*Emulates or patches code by* Michael Sharpe.)

Pkg lwarp-common-mathjax-newpxtxmath

Common code used by newpxmath, newtxmath, and newtxsf for MathJax.

for HTML output:

```
\ProvidesPackage{lwarp-common-mathjax-newpxtxmath}[2020/09/20]
```

For MathJax:

```
\LWR@origRequirePackage{lwarp-common-mathjax-nonunicode}
\LWR@origRequirePackage{lwarp-common-mathjax-overlaysymbols}

Index of Objects

This is an index of macros, environments, booleans, counters, lengths, packages, classes, options, keys, files, and various other programming objects. Each is listed by itself, and also by category. In some cases, they are further subdivided by [class].

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition.

Troubleshooting Index

This index is a sorted reference of problems and solutions. In order to make it easier to locate a solution, the same issue may be addressed by more than one entry.

Entries starting with page 200 are often duplicates of entries with lower page numbers, as the same warning may occur within the user manual and again within the source code.
